SECTION 1 GENERAL INFORMATION**1.1 Initial Inspection**

It is recommended that the shipment be thoroughly inspected immediately upon delivery to the purchaser. All material in the container should be checked against the enclosed Packing List. LeCroy cannot accept responsibility for shortages in comparison with the Packing List unless notified promptly. If the shipment is damaged in any way, please contact the Customer Service Department or local field office immediately.

1.2 Warranty

LeCroy warrants its oscilloscope products to operate within specifications under normal use for a period of three years from date of shipment. Spares, replacement parts and repairs are warranted for 90 days. The instrument's firmware is thoroughly tested and thought to be functional, but is supplied "as is" with no warranty of any kind covering detailed performance. Products not manufactured by LeCroy are covered solely by the warranty of the original equipment manufacturer.

In exercising this warranty, LeCroy will repair or, at its option, replace any product returned to the Customer Service Department or an authorized service facility within the warranty period, provided that the warrantor's examination discloses that the product is defective due to workmanship or materials and that the defect has not been caused by misuse, neglect, accident or abnormal conditions or operation.

LeCroy will return all in-warranty products with transportation prepaid.

This warranty is in lieu of all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness, or adequacy for any particular purpose or use. LeCroy shall not be liable for any special, incidental, or consequential damages, whether in contract or otherwise.

1.3 Product Assistance

Answers to questions concerning installation, calibration, and use of LeCroy equipment are available from the Customer Service Department, 700 Chestnut Ridge Road, Chestnut Ridge, New York 10977-6499, U.S.A., tel: (914) 578-6060, or 6061, and 2 rue du Pré-de-la-Fontaine, 1217 Meyrin 1, Geneva, Switzerland, tel : (41) 22.719.21.11, or your local field engineering office.

1.5 Maintenance Agreements

LeCroy offers a selection of customer support services. Maintenance agreements provide extended warranty and allow the customer to budget maintenance costs after the initial three years warranty has expired. Other services such as installation, training, enhancements and on-site repair are available through specific Supplemental Support Agreements.

1.6 Documentation Discrepancies

LeCroy is committed to providing state-of-the-art instrumentation and is continually refining and improving the performance of its products. While physical modifications can be implemented quite rapidly, the corrected documentation frequently requires more time to produce. Consequently, this manual may not agree in every detail with the accompanying product. There may be small discrepancies in the values of components for the purposes of pulse shape, timing, offset, etc., and, occasionally, minor logic changes. Where any such inconsistencies exist, please be assured that the unit is correct and incorporates the most up-to-date circuitry. In a similar way the firmware may undergo revision when the instrument is serviced. Should this be the case, manual updates will be made available as necessary.

1.7 Service Procedure

Products requiring maintenance should be returned to the Customer Service Department or authorized service facility. LeCroy will repair or replace any product under warranty at no charge. The purchaser is only responsible for one way transportation charges.

For all LeCroy products in need of repair after the warranty period, the customer must provide a Purchase Order Number before repairs can be initiated. The customer will be billed for parts and labor for the repair, as well as for shipping.

1.8 Return Procedure

To determine your nearest authorized service facility, contact the Customer Service Department or your field office. All products returned for repair should be identified by the model and serial numbers and include a description of the defect or failure, name and phone number of the user, and, in the case of products returned to the factory, a Return Authorization Number (RAN).

The RAN may be obtained by contacting the customer service department in New York, tel: (914)578-6060, or 6061 ; in Geneva, tel: (41)22/719.21.11, or your nearest sales office. Return shipment should be made prepaid. LeCroy will not accept C.O.D. or Collect Return Shipments. Air-freight is generally recommended. The oscilloscope should be packed with the protective cover in place. Wherever possible, the original shipping carton should be used. If a substitute carton is used, it should be rigid and be packed such that the product is surrounded with a minimum of four inches of excelsior or similar shock-absorbing material. In addressing the shipment, it is important that the Return Authorization Number be displayed on the outside of the container to ensure its prompt routing to the proper department within LeCroy.

1.9 Safety Precautions

The following servicing instructions are for use by qualified personnel only. Do not perform any servicing other than contained in service instructions. Refer to procedures prior to performing any service.

Exercise extreme safety when testing high energy power circuits. Always turn the power OFF, disconnect the power cord, discharge the cathode ray tube and all capacitors before disassembling the instrument.

The **WARNING** symbol used in this manual indicates dangers that could result in personal injury.

The **CAUTION** symbol used in this manual identify conditions or practices that could damage the instrument.

1.10 Antistatic Precautions

CAUTION

Any static charge that builds on your person or clothing may be sufficient to destroy CMOS components, integrated circuits.

In order to avoid possible damage, the usual precautions against static electricity are required.

- Handle the boards in antistatic boxes or containers with foam specially designed to prevent static build-up.
- Ground yourself with a suitable wrist strap.
- Disassembly the instrument at a properly grounded work station equipped with antistatic mat.
- When handling the boards, do not touch the pins.
- Stock the boards in antistatic bags.

SECTION 2 SPECIFICATIONS

9374/M/L/TM Digital Oscilloscope

9370 Series Digital Oscilloscopes 1 GHz Bandwidth, 2 GS/s

Main Features

- Up to 8M-point record length
- 8-bit vertical resolution, 11-bit with ERES option
- Two- and four-channel versions
- Hard Disk (PCMCIA III), Memory Card and DOS-compatible Floppy Disk options
- Innovative Peak Detect
- Glitch, Pattern, Qualified, Interval, Dropout and TV triggers
- Fully programmable via GPIB and RS-232-C
- Internal graphics printer option
- Automatic PASS/FAIL testing
- Advanced signal processing

1 GHz Bandwidth

The 9370 series digital storage oscilloscope opens up new horizons for engineers and scientists at the leading edge of technological developments. With 1 GHz bandwidth and long acquisition memories, it is now possible to reveal previously hidden waveform details. Narrow glitches are more accurately defined; risetime measurements below 1 nanosecond are more precise; and high-frequency content, filtered out in lower bandwidth systems, is retained, thereby preserving signal amplitudes and overall signal integrity.

2 GS/s Sample Rate

The 2- and 4-channel models of the 9370 series sample simultaneously on all channels at 500 MS/s. Thus, they are ideal for demanding high speed applications. In addition, two channels can be combined to provide a sample rate of 1 GS/s. The 9374 provides 2 GS/s in single channel mode. Finer horizontal resolution and accuracy are guaranteed by high sample rates. This is especially critical in digital design where unpredictable circuit behavior has to be identified and analyzed in detail to be fully understood. Together with this excellent single-shot performance the 9370 series also provides a sample rate equivalent to 10 GS/s for repetitive signals.

8M Point Acquisition Memory

Channel memory lengths of 50k, 250k, 500k and 2M are available on the 9370 series 2- and 4-channel DSOs. The memory power is revealed when the user seeks to sample at the highest speed over many timebase settings. Short memory DSOs may boast a high sample rate for short waveforms, but only a long memory oscilloscope can deliver high sample rates for long waveforms. To exploit this capability to its fullest the LeCroy 9370 series combines its channel acquisition memories to give the user up to 8 million sample points, thereby providing the waveform detail required on long and complex signals.

The combined capabilities of the 9370 series place it in the forefront of DSO capability.

Features and Benefits

WIDE BANDWIDTH

1 GHz bandwidth results in greater accuracy of amplitude measurements for high frequency signals and true representation of high speed digital signals.

HIGH SAMPLE RATES

Sample rates of 500 MS/s, 1 GS/s and 2 GS/s provide greater waveform fidelity, excellent zoom detail, protection against aliasing, better time resolution and wider frequency spectrum.

CHANNEL INTERLEAVING

Memory length is extended by combining the acquisition memories of multiple channels for both continuous or segmented waveform recording. Combining channels yields higher sample rates.

ADVANCED PEAK DETECT SYSTEM

The 9370 series offers an innovative peak detect capture mode. This captures fast glitches or other signal details that might have been missed due to undersampling by running the ADC's at a high sampling rate even on slow time bases. At the same time the scope also stores the underlying data to ensure no loss of time precision - unlike other peak detect systems.

SMART TRIGGER SYSTEM

SMART Trigger functions including Glitch, Pattern, Dropout, State- or Edge Qualified triggers are available. Pre- and Post-trigger delay are fully variable. Time and Events Holdoff are also included.

The Smart Trigger system allows the scope to trigger on a large variety of signal types, specific signal characteristics and suspect behaviors.

ProBus™ HIGH PERFORMANCE PROBE INTERFACE

The proprietary ProBus interface is supplied as standard on all 93XX family models. It provides a probe interconnection architecture to support the most demanding circuit probing requirements, both now and in the future.

The ProBus interface allows automatic detection of the attached probe as well as complete control, setup and calibration at the probe tip. The probe is no longer an accessory, but an integral part of the measurement solution, with ease of setup and probe-tip measurement accuracy guaranteed.

The ProBus interface supports a rapidly growing range of high-performance and custom probe solutions including high-bandwidth, low-circuit load FET probes.

HIGH RESOLUTION DISPLAY AND EXCELLENT USER INTERFACE

A large high resolution CRT display supports uncluttered presentation of waveform data, information and control menus. Live waveforms can be viewed with up to three expansion regions showing all of the signal details.

The powerful processing capability provides a responsive feel even when extensive processing is being carried out. A proven multi-knob control panel combined with an intuitive menu system provide rapid access to the instrument's powerful capabilities.

PERSISTENCE AND XY DISPLAY MODES

Persistence: Sample points are displayed so that they accumulate on the screen over many acquisitions. "Eye diagrams" and "Constellation displays" can be achieved using this display mode. XY mode plots any two sources against one another.

WAVEFORM PROCESSING AND MEASUREMENT SYSTEM

Pass/Fail Testing and Waveform Limit Testing (Masks) can be performed. Measurements include Pulse Parameters, Statistics and Arithmetic functions. Any failure can cause preprogrammed actions such as Hardcopy, Save, GPIB Service Request, Pulse Out or Beep.

OPTIONAL WAVEFORM MATH PACKAGE - WP01*

Option WP01 provides Summed and Continuous Averaging, Waveform Math Functions, Extrema and Enhanced Resolution Modes.

Functions can be chained together, allowing complex computations. Waveform operations can be performed on live, stored, processed or expanded waveforms. The package is fully programmable over GPIB or RS-232-C. WP01 extends the processing capabilities of the 9370 and reduces the need for external computers and controllers for processing.

OPTIONAL SPECTRAL ANALYSIS PACKAGE - WP02*

Option WP02 provides comprehensive Spectral Analysis capabilities, permitting the system designer to identify characteristics which may not be apparent in the

time domain. WP02 provides a wide selection of windowing functions, as well as averaging in the frequency domain.

Spectral analysis can be performed on repetitive and single events. Users can obtain time and frequency values simultaneously and compare phases of the various frequency components with each other.

OPTIONAL STATISTICAL ANALYSIS PACKAGE - WP03

Option WP03 provides extensive statistical analysis capabilities. Detailed analysis can easily be performed on difficult to measure waveform phenomena such as amplitude fluctuation and timing jitter. Live histogram displays represent the statistical distribution of selected waveform parameter measurements. Statistical information can be extracted directly from the histograms using automatic statistical measurements including max, min, average, median, std deviation, etc.

MAGNETIC MEDIA MEASUREMENTS

The DDM/PRML disk drive firmware options provide a unique integrated tool for those developing and testing high-density storage media.

DOS COMPATIBLE MASS STORAGE OPTIONS*

The 9370 series offers 131MB removable hard disk (PCMCIA III), high speed memory card (PCMCIA II) and 3.5" 1.44 MB floppy disk. Traces, setups, screen graphics and Pass/Fail templates can be stored as DOS files and thus read directly by a PC for easy integration into reports.

PRINTING FACILITIES*

An optional internal thermal graphics printer produces full resolution screen dumps in under 10 seconds. The unique 'Strip-Chart' format expands the horizontal axis up to 2 meters per division for viewing fine waveform detail within long memory acquisitions.

A wide range of printer/plotter formats support external hardcopy via the standard GPIB, RS-232-C or optional Centronics interfaces.

REMOTE PROGRAMMING CAPABILITY

Remote programming capability enables DSO control from PC and easy transfer of data for further analysis. The full command set is available via remote control.

9370 Series Specifications

ACQUISITION SYSTEM

Bandwidth (-3 dB):

- @ 50 Ω : DC to 1 GHz
10 mV/div and above
- @ 1 M Ω DC: DC to 500 MHz typ. at probe tip,
with PP005 supplied standard.
1 GHz FET probe optional.

No. of Channels: 4 (9374) or 2 (9370)

No. of Digitizers: 4 (9374) or 2 (9370)

Maximum Sample Rate and Acquisition

Memories: See table below.

Sensitivity:

- 2 mV/div to 1 V/div, 50 Ω , fully variable
2 mV/div to 10 V/div, 1M Ω , fully variable.

Scale factors: A wide choice of probe
attenuation factors are selectable.

Offset Range:

- 2.00 - 4.99 mV/div: ± 400 mV
5.00 - 99 mV/div: ± 1 V
0.1 - 1.0 V/div: ± 10 V
1.0 - 10V/div: ± 100 V (1M Ω only)

DC Accuracy: Typically 1%.

Vertical Resolution: 8 bits.

Bandwidth Limiter: 25 MHz, 200 MHz.

Input Coupling: AC, DC, GND.

Input Impedance: 1 M Ω /15 pF or 50 Ω $\pm 1\%$.

Max Input:

- 1 M Ω : 400 V (DC+ peak AC ≤ 10 kHz)
50 Ω : ± 5 V DC (500 mW) or 5 V RMS

TIME BASE SYSTEM

Timebases: Main and up to 4 Zoom Traces.

Time/Div Range: 1 ns/div to 1,000 s/div.

Clock Accuracy: ≤ 10 ppm

Interpolator resolution: 10 ps

Roll Mode: Ranges 500 ms to 1,000 s/div.

For > 50k points: 10 s to 1,000 s/div.

External Clock: ≤ 100 MHz on EXT input with
ECL, TTL or zero crossing levels. Optional
50 MHz to 500 MHz rear panel fixed frequency
clock input.

External Reference: Optional 10 MHz rear-
panel input.

TRIGGERING SYSTEM

Trigger Modes: Normal, Auto, Single, Stop.

Trigger Sources: CH1, CH2, Line, Ext,
Ext/10 (9374: CH3, CH4). Slope, Level and
Coupling for each source can be set indepen-
dently.

Slope: Positive, Negative.

Coupling: AC, DC, HF, LFREJ, HFREJ.

Pre-trigger recording: 0 to 100% of full scale
(adjustable in 1% increments).

Post-trigger delay: 0 to 10,000 divisions
(adjustable in 0.1 div increments).

Holdoff by time: 10 ns to 20 s.

Holdoff by events: 0 to 99,999,999 events.

Internal Trigger Range: ± 5 div.

EXT Trigger Max Input:

1 M Ω /15 pF: 400 V (DC + peak AC ≤ 10 kHz)
50 Ω $\pm 1\%$: ± 5 V DC (500 mW) or 5 V RMS

EXT Trigger Range: ± 0.5 V (± 5 V with Ext/10)

Trigger Timing: Trigger Date and Time are
listed in the Memory Status Menu.

Trigger Comparator: Optional ECL rear
panel output.

SMART TRIGGER TYPES

Pattern: Trigger on the logic AND of 5 inputs -
CH1, CH2, CH3, CH4, and EXT Trigger,
(9370: 3 inputs - CH1, CH2, EXT) where each
source can be defined as High, Low or Don't
Care. The Trigger can be defined as the
beginning or end of the specified pattern.

Signal or Pattern Width: Trigger on width
between two limits selectable from ≤ 2.5 ns to
20 s. Will typically trigger on glitches 1 ns
wide.

Signal or Pattern Interval: Trigger on interval
between two limits selectable from 10 ns to
20 s

Dropout: Trigger if the input signal drops out
for longer than a time-out from 25 ns to 20 s.

State/Edge Qualified: Trigger on any source

only if a given state (or transition) has occurred
on another source. The delay between these
events can be defined as a number of events
on the trigger channel or as a time interval.

TV: Allows selection of both line (up to 1500)
and field number (up to 8) for PAL, SECAM,
NTSC or nonstandard video.

ACQUISITION MODES

Random Interleaved Sampling (RIS):

For repetitive signals from 1 ns/div to 5 μ s/div.

Single shot: For transient and repetitive
signals from 10 ns/div (all channels active).

Peak detect: Captures and displays 2.5 ns
glitches or other high-speed events.

Sequence: Stores multiple events in seg-
mented acquisition memories.

Number of segments available:

9370-9374	2-200
9370M-9374M	2-500
9370L-9374L-9374TM	2-2,000

Max. Dead Time between segments: 100 μ s

DISPLAY

Waveform style: Vectors connect the indi-
vidual sample points, which are highlighted as
dots. Vectors may be switched off.

CRT: 12.5x17.5 cm (9" diagonal) raster.

Resolution: 810 x 696 points.

Modes: Normal, X-Y, Variable or Infinite
Persistence.

Real-time Clock: Date, hours, minutes,
seconds.

Graticules: Internally generated; separate
intensity control for grids and waveforms.

Grids: 1, 2 or 4 grids.

Formats: YT, XY, and both together.

Vertical Zoom: Up to 5x vertical expansion
(50x with averaging, up to 40 μ V sensitivity,
only with WP01).

Maximum Horizontal Zoom Factors:

9370-9374	2,000x
9370M-9374M	10,000x
9370L-9374L-9374TM	100,000x

Waveforms can be expanded to give 2-2.5
points/division. This allows zoom factors up to
400,000x for the 9374L when channels are
combined.

INTERNAL MEMORY

Waveform Memory: Up to four 16-bit
Memories (M1, M2, M3, M4).

Processing Memory: Up to four 16-bit
Waveform Processing Memories (A, B, C, D).

Setup Memory: Four non-volatile memories.
Optional Cards or Disks may also be used for
high-capacity waveform and setup storage.

Channel Use	Maximum Sample rate	Memory per Channel				Active Channels
		9370 9374	9370M 9374M	9374TM	9370L 9374L	
All Peak Detect OFF	500 MS/s	50k	250k	500k	2M	All
Paired Peak Detect OFF	1 GS/s	100k	500k	1M	4M	9370: CH1 9374: CH2 & CH3
Paired + PP093 Peak Detect OFF	2 GS/s	200k	1M	2M	8M	One (PP093 input) 9374 models only
All Peak Detect ON	100 MS/s data + 400 MS/s peak	25k data + 25k peaks	100k data + 100k peaks	250k data + 250k peaks	1M data + 1M peaks	All 2.5 ns Peak Detect

CURSOR MEASUREMENTS

Relative Time: Two cursors provide time measurements with resolution of $\pm 0.05\%$ full scale for unexpanded traces; up to 10% of the sampling interval for expanded traces. The corresponding frequency value is displayed.

Relative Voltage: Two horizontal bars measure voltage differences up to $\pm 0.2\%$ of full scale in single-grid mode.

Absolute Time: A cross-hair marker measures time relative to the trigger and voltage with respect to ground.

Absolute Voltage: A reference bar measures voltage with respect to ground.

WAVEFORM PROCESSING

Up to four processing functions may be performed simultaneously. Functions available are: Add, Subtract, Multiply, Divide, Negate, Identity, Summation Averaging and Sine x/x .

Average: Summed averaging of up to 1,000 waveforms in the basic instrument. Up to 10^6 averages are possible with Option WP01.

Extrema: Roof, Floor, or Envelope values from 1 to 10^6 sweeps.

ERES: A selection of six Low-Pass digital filters provides up to 11 bits vertical resolution.

Sampled data is always available, even when a trace is turned off. Any of the above modes can be invoked without destroying the data.

FFT: Spectral Analysis with five windowing functions and FFT averaging.

**Extrema and ERES modes are provided in Math Package WP01. FFT is in WP02.*

AUTOSETUP

Pressing Autsetup sets timebase, trigger and sensitivity to display a wide range of repetitive signals. (Frequency above 50Hz; Duty Cycle greater than 0.1%).

Autosetup Time: Approximately 2 seconds.

Vertical Find: Automatically sets sensitivity and offset.

PROBES

Model: One PP005 (10:1, 10 M Ω // 11 pF) probe supplied per channel. 500 V max input. The 9370 series is fully compatible with LeCroy's range of FET probes, which may be purchased separately.

Probe calibration: Max 1 V into 1 M Ω .

500 mV into 50 Ω , frequency and amplitude programmable, pulse or square wave selectable, rise and fall time 1 ns typical.

Alternatively, the calibrator output can provide a trigger output or a PASS/FAIL test output.

INTERFACING

Remote Control: Possible by GPIB and RS-232-C for all front-panel controls, as well as all internal functions.

RS-232-C Port: Asynchronous up to 19200 baud for computer/terminal control or printer/plotter connection.

GPIB Port: (IEEE-488.1) Configurable as talker/listener for computer control and fast data transfer. Command Language complies with requirements of IEEE-488.2.

Centronics Port: Optional hardcopy parallel interface.

Hardcopy: Screen dumps are activated by a front-panel button or via remote control. TIFF and BMP formats are available for importing to Desktop Publishing programs. The following printers and plotters can be used to make hardcopies: HP DeskJet (color or BW), HP ThinkJet, QuietJet, LaserJet, PaintJet and EPSON printers; HP 7470 and 7550 plotters or similar, and HPGL-compatible plotters. An internal high resolution graphics printer is also available.

GENERAL

Auto-calibration ensures specified DC and timing accuracy.

Temperature: 5° to 40° C (41° to 104° F) rated 0° to 50° C (32° to 122° F) operating.

Humidity: <80%.

Shock & Vibration: Meets MIL-STD-810C modified to LeCroy design specifications and MIL-T-28800C.

Safety: Conforms to EN 61010-1.

EMC: Conforms to EN50081-1, EN 50082-1.

Power: 90-250 V AC, 45-66 Hz, 230 W.

Battery Backup: Front-panel settings maintained for two years.

Dimensions: (HWD) 8.5"x14.5"x16.25", 210mm x 370mm x 410mm.

Weight: 13 kg (28.6 lbs) net, 18.5 kg (40.7 lbs) shipping.

Warranty: Three years.

Note: The 9374TM model includes WP01/02, floppy disk and graphics printer.

9300 Series PCMCIA Portable Hard Disk, Internal Printer, 3.5" Floppy Disk Drive and Ram Card

Main Features

- PCMCIA Type III Portable Hard Disk, DOS Compatible
- High-resolution Printer, ideal for fast, on-the-spot documentation
- 3.5" Floppy disk drive, DOS format - affordable and convenient
- Ultra-fast RAM card, DOS format, ideal for PASS/FAIL testing
- Convenient Hardcopy storage to card/disk

3.5" Floppy

The floppy drive is a convenient storage medium, not only for saving and retrieving waveforms or instrument settings, but also for storing hardcopies that can be printed from a PC when desired. The floppy supports both 720k and 1.44M DOS formats so that it can be read back on any PC with a 3.5" drive, avoiding the need to interface the oscilloscope to your PC. As with the RAM-card option, the floppy system capabilities include automatic storage of data under pre-programmed conditions.

PCMCIA Storage

PCMCIA Interfaces for RAM card and Hard Disk allow the use of fast, removable and compact storage media for saving and retrieving waveforms and instrument settings. They comply fully with the PC industry's PCMCIA and JEIDA standards. With the special Autostore feature, waveforms can be automatically stored after every acquisition and "played back" when desired. When used in combination with the PASS/FAIL feature, failure data can be saved automatically for later analysis.

Printer

The internal printer is an invaluable tool for instant, on-the-spot documentation. It generates a clear, crisp hardcopy of the screen in just a few seconds. The large size of the printout, combined with its high resolution, provide you with an excellent document that matches the screen's superior quality to its finest details. And because it frees you from the trouble of carrying and interfacing a bulky printer, it is the ideal solution for field measurements.

Mass Storage Features and Benefits

LeCroy's mass storage capabilities provide a range of benefits:

- Easy data transfers to PCs
- Waveform logging
- Waveform archiving for future use
- Faster troubleshooting
- Faster, more reproducible testing
- Shared oscilloscope resources

EASY DATA TRANSFER TO PC

Because the 9300 series oscilloscope uses DOS-formatted floppy disks, hard disks and memory cards, transferring waveform data to a PC is simple. The removable storage allows transfers without cables, programming, or any knowledge of GPIB, RS-232, or other interfaces.

In addition, LeCroy provides free of charge, a binary-to-ASCII format conversion program for the PC, accommodating those PC-based analysis packages (such as spreadsheets) that require ASCII format.

WAVEFORM LOGGING

By using Glitch or Dropout triggering in combination with the powerful AUTO-STORE mode, LeCroy oscilloscopes can monitor and log intermittent problems automatically. To store a waveform, the oscilloscope opens and names a DOS-compatible file and then stores the waveform data in the file. This logging feature requires no operator intervention and maintains data and the operational setup through power line failures. Logged waveforms can be selectively played back by trigger time/date or by sequence number, or can be scrolled through sequentially.

WAVEFORM ARCHIVING FOR FUTURE USE

- Recallable proof of performance
- Additional data analysis as needed
- Accurate trend or drift monitoring
- Calibration procedure verification

When storing waveforms, LeCroy DSOs also archive a header of setup information and the acquisition time/date. After recalling an archived waveform, the several hundred byte header ensures correct time and voltage scaling. When recalled into the oscilloscope, the waveform can be zoom expanded,

compared, or analyzed just like a live waveform. The time/date offers proof of measurement authenticity and trend sequence.

All LeCroy DSOs store raw waveform data using one byte per sample point. Signal averaged, Enhanced Resolution (ERES) filtered, and other processed data use two bytes per point, to take advantage of the added resolution.

HARDCOPY ARCHIVING

Hardcopies of the screen can also be stored for future use. For instance, a screen saved in TIFF format can be imported into a Word Processor to illustrate a report. Additionally, field-measurement screens can be saved in LaserJet format on the memory card or floppy disk, and then printed from a PC back in the lab.

FASTER FIELD MEASUREMENTS

Recallable reference waveforms and oscilloscope setups for each test point on a Device Under Test (DUT) can make fault troubleshooting faster and more accurate. A dedicated memory card or floppy disk will hold all of the correct test point waveforms and associated DSO setups for a particular DUT.

The technician can recall stored setups quickly and consistently, thereby avoiding incorrect measurement conditions. He can then compare actual waveforms to recalled reference waveforms taken from a known working system. He will therefore spend less time probing a large number of test points and verifying that the correct waveforms exist.

If a problem is found, the aberrant waveform may be saved. It can later be shown to laboratory-based engineers, for example, for problem-solving guidance or for improvement of DUT design.

Memory cards - rugged and pocket-sized - are ideal for this application.

FASTER, MORE REPRODUCIBLE TESTING

LeCroy oscilloscopes will compare measured waveforms against upper and lower waveshape tolerances or against parameter limits, such as risetime, overshoot, or peak voltage, and make PASS/FAIL decisions. This PASS/FAIL

testing decreases test times in GPIB-based ATE systems by reducing data transfers. It increases reproducibility and accuracy in manual tests by eliminating human errors.

Once defined, these tests may be saved by storing instrument setups which include the specified tolerances and/or reference waveforms. Different test personnel can easily share a common test library via a PC network.

Waveshape test limits can be generated by capturing a "golden" waveform and by then selecting amplitude and timing limits (in fractions of screen graticule divisions). Or a user can create standard waveform limit templates on a computer (e.g. ANSI/CCITT telecommunication templates).

With the LeCroy 9300 series DSOs, specific parameter tolerance test procedures are created by selecting limits for any five out of thirty plus pulse parameters with Boolean AND / OR conditions between them. During testing, FAIL responses can include an audible beep, GPIB SRQ, hardcopy output, or store to memory card.

SHARED OSCILLOSCOPE RESOURCES

By plugging-in your *personal* floppy disk, RAM card or PCMCIA Hard Disk you can restore your setup in seconds. Individual users can keep preferred setups on separate disks or cards or within separate directories.

Hardcopy Features and Benefits

The internal printer adds a whole range of benefits to the LeCroy 9300 series:

- Ultra-fast printouts
- High resolution printing
- Easy transportation
- Trouble-free interfacing
- Auto Print on Trigger

ULTRA-FAST PRINTOUTS

Measurement documentation is made easier and faster since the internal printer produces a hardcopy in less than 10 seconds. In addition the document is date- and time-stamped: a real bonus for archiving test results.

HIGH RESOLUTION PRINTING

With a resolution of 190 dots-per-inch, the internal printer matches the screen's superior quality. And for even higher resolution, the printout can be stretched to a full 70 meter length so you can see those traces down to their finest details.

EASY TRANSPORTATION

A printer that is totally integrated in the instrument makes life much easier for field-measurement applications. Imagine carrying a scope, a printer (and perhaps a floppy drive) in one hand!

TROUBLE-FREE INTERFACING

The internal printer frees your mind from the struggle with cable schematics, baud rates, gender-changers and dip switches, for more productive tasks. Select the internal printer in the scope's utilities menu, hit the SCREEN DUMP button, and you're in business!

AUTO PRINT ON TRIGGER

The Auto Print feature is used to print a screen image on each acquisition.

The 9300 series oscilloscope supports a whole range of popular printers and plotters. Hardcopies can be either sent directly to the peripheral device or to the floppy disk, Ram Card or Hard disk for future use.

plot size	<input type="radio"/> A5 (8.5"/5.5") <input checked="" type="radio"/> A4 (11"/8.5")
pen number	<input type="text" value="2"/>

OTHER HARDCOPY SOLUTIONS

High quality project reports, presentation materials, technical manuals, and troubleshooting instructions often require integration of text and graphics on the same page.

Advanced PC desktop publishing and word processors such as Word-for-Windows, WordPerfect, or AMI Pro can directly import graphic files, size them, and position them anywhere on the page. Written text can then wrap around or be positioned within the graphics.

LeCroy 9300 oscilloscopes will save screens in TIFF (Tagged Image Format File), or BMP. After transferring the file to a PC, the DTP software can import and manipulate the document like any other graphic object.

The LeCroy 9300 series also offers a wide range of interfacing capabilities with external hardcopy devices:

- Plotters. HPGL, HP 7400 and 7500 compatible
- Printers. HP LaserJet, ThinkJet, Paintjet (including color), DeskJet (including color) and Epson
- Interfacing. RS-232, GPIB, or even Centronics (optional)

LeCroy

The Digital Scope Specialists

AP003, AP020 and AP021 Active FET Probes

Main Features

- Bandwidths to 1 GHz
- LeCroy ProBus™ interface for the AP020 and the AP021
- 1 MΩ input Impedance
- Low capacitance at probe tip
- Rugged mechanical construction
- Automatic sensing and control on scopes equipped with ProBus™

FET Probes provide the oscilloscope user with a higher level of measurement capability. Compared with passive probes, they offer low circuit loading, low capacitance and high bandwidth. This combination makes them the ideal tools for working on sensitive or high-speed electronics.

This performance is achieved by the integration of a high-impedance Field Effect Transistor (FET) amplifier into the probe tip. The circuit under test sees only the amplifier's input impedance - it is effectively buffered from the scope's input impedance and the probe cable.

LeCroy's AP series of FET probes are mechanically rugged in design, while their miniature construction allows them to be used in hand-held PCB probing applications. Their detachable tips are designed for simple replacement, and they are supplied with a full set of accessories.

Models AP020 and AP021 offer 1 GHz and 800 MHz Bandwidth respectively. AP020 features X10 signal attenuation and is especially recommended for LeCroy's 9320 and 9324 1 GHz oscilloscopes. The AP021 offers X5 attenuation when used with the new 9360.

As an active device, the FET probe requires a stabilized power supply. LeCroy provides an elegant solution to this with the ProBus™ probe interface.

ProBus™ provides probe power and signal connection in one integrated package. It also allows the scope to control other probe functions, such as input coupling and DC offset. The ProBus™ interface is now available on a growing range of LeCroy oscilloscopes and probes. AP003 has an external power connector for use with scopes which are not ProBus™ compatible. All other models use the ProBus™ interface.

Features and Benefits

Connecting a probe to a circuit can significantly distort its signals by adding undesired loading - mostly capacitive and resistive. FET probes offer high resistance and low capacitance therefore they present minimal loading to the circuit under test, and protect from making erroneous measurements.

HIGH RESISTANCE

Low resistance probes have significant DC effects when used in high impedance circuits. They can greatly affect the behaviour of the device under test by changing the swing and the DC offset of the probed signal. A 1 M Ω impedance FET probe will not affect gain or offset in virtually all the cases.

LOW CAPACITANCE

Although not important in DC measurements, capacitive loading is very

disruptive at high signal frequencies. The capacitive loading effects can be drastic. When probed with a 10 M Ω , 15

Probe Impedance versus Frequency

pF passive probe, a 100 MHz signal "sees" a 100 Ω load as illustrated on the picture below.

With only 2 pF of capacitance at the probe tip, LeCroy's FET probes reduce

circuit loading at high frequencies by a factor of 10. Minimizing tip capacitance can also push the probe's resonant frequency beyond the system bandwidth. Sensitivity to ground lead inductance is also minimized.

PROBUS

The ProBus™ system is a complete measurement solution from probe tip to oscilloscope display. It supplies power to active probes, while automatically sensing probe attenuation. ProBus™ enables direct control of the probe offset and input coupling from the scope's front panel, extending the instrument's accuracy up to the probe tip. In addition, ProBus™ automatically optimizes scope and probe offset adjustments, calibrates the gain at the probe tip and compensates for non-linearities, providing most accurate measurements.

The Digital Scope Specialists

AP030, SI 9000 and SI 9000A Active Differential Probes

Main Features

- Bandwidths to 15 MHz
- Multiple:
 - Attenuations
 - Differential Voltage Ranges
 - Common Mode Voltages
- High Input Impedance
- Rugged and Lightweight
Mechanical Construction

The Models AP030, SI 9000 and SI 9000A are fully differential active probes designed for applications where electric signals must be measured relative to a floating voltage, other than ground potential.

These probes are designed specifically for situations where:

- the reference voltage may be several hundreds volts above or below ground;

- measurements require the rejection of common-mode signals, (e.g. to evaluate small amplitude pulses riding on big common-mode signals);
- ground loops and currents produce so much interference that small signals cannot be detected.

With these differential probes the oscilloscope user avoids both the dangerous practice of floating the

scope, and the technique of using two scope channels in "Invert and Add" mode, which is limited both in common mode rejection and in dynamic range.

Models AP030, SI 9000 and SI 9000A are lightweight and easy to use. They have the rugged mechanical construction required for laboratory, manufacturing and field service environments, and are battery powered for greater safety and convenience.

Features and Benefits

FULLY DIFFERENTIAL INPUTS

The probes are fully differential active devices. The differential technique allows measurements to be made between two points in a circuit without reference to ground. The two input signals are processed inside the probe (as illustrated in figure) and the resulting single-ended signal may be measured by any grounded oscilloscope.

HIGH COMMON MODE VOLTAGE

The three probes offer a range of Common Mode Voltages from 40 V to 1000 V.

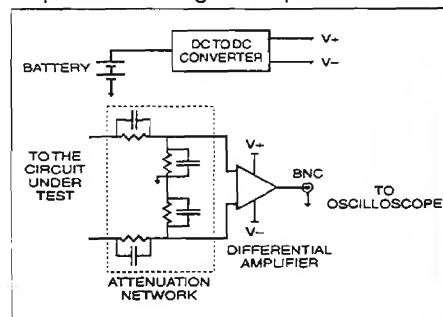

RUGGED CONSTRUCTION

The probes are designed to be compact and lightweight with power provided by four AA size 1.5 V batteries. A rubber casing enhances the probes' resistance to shocks.

SAFETY

Use of differential probes is safe within the specified voltages. Their

use avoids less reliable alternatives, or possible dangerous practices.

Innovators in Instrumentation

AP011 Current Probe

Main Features

- DC, AC or impulse currents
- 150A maximum current
- DC - 120 kHz Bandwidth
- Probe Accuracy $1\% \pm 2\text{mA}$
- Measurement units in amperes
- ProBus™ compatible, sensed automatically by the 93XX family of oscilloscopes.
- Rugged mechanical design

CURRENT MEASURING

The AP011 allows the oscilloscope to measure current flowing through a conductor. The AP011 is based on a combination of Hall effect and transformer technology which allows measurements to be made on DC, AC and impulse currents. It is rugged in design and uses a split-core transformer to allow the probe head to be clamped around a conductor that remains in circuit.

FULLY INTEGRATED

With the ProBus™ interface, the AP011 probe becomes an integral part of the oscilloscope. The probe is automatically detected with full calibration and control achieved from the on-screen menu system. No external power supplies or amplifiers are required.

Full Remote control is possible over GPIB or RS-232-C interfaces.

SCALED MEASUREMENTS

Waveform scaling factors and unit conversions are automatically applied.

The existing wide range of oscilloscope software analysis functions and parameter measurements are compatible and handle mixed unit conversion.

Features and Benefits

FULLY INTEGRATED SYSTEM

ProBus™ compatibility ensures full integration of the AP011 features into the oscilloscope. The probe is fully operational whenever it is attached to the instrument. There is no need for external amplifiers or power supplies. All controls are menu-driven from the oscilloscope screen, avoiding the need for accessing probe mounted controls which can be particularly difficult and dangerous in some applications.

AUTO-ZERO ADJUSTMENT

Optimal calibration of the probe is achieved by using the Auto-Zero feature. This should be done whenever the probe is first connected, subjected to wide temperature variations, re-oriented with respect to the earth's magnetic field, or subjected to overload conditions. The auto-zero operation on the AP011 is performed automatically by pressing the 'AUTO ZERO' menu button in the associated channel menu (see Figure 1).

AUTOMATIC MEASUREMENT UNIT CONVERSION

Automatic unit conversion and calibration ensures correct interpretation of data and avoids the painstaking task of recording and applying conversion and scaling factors.

All waveforms acquired from the AP011 are automatically calibrated and adjusted to be scaled in ampere units. A wide range of functions can be applied to current waveforms. Advanced functions such as FFT's and statistical analysis are available as optional firmware packages.

All functions and measurements recognize ampere vertical scales and adjust the resulting waveform or calculation units, including mixed unit conversions (e.g. current multiplied by voltage as shown in Figure 1).

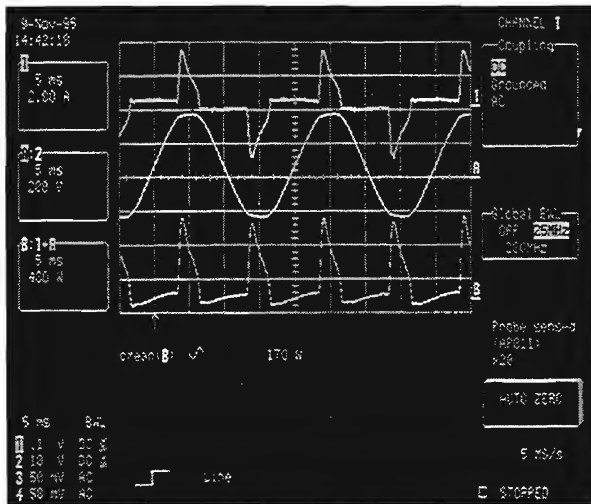

Figure 1: This example shows a power supply input current (top trace) vs. voltage (middle trace). These are multiplied to provide the input power waveform (lower trace). A parameter measurement is then made to calculate the mean input power.

Note that the input coupling menu is automatically configured to control the AP011 attached to that channel.

 100:1 @ 10 kHz

GENERAL CHARACTERISTICS

Operating Temperature: 0°C to 50°C
 Max Conductor Size: 19mm
 Cable Length: 2m
 Interface: ProBus™, 1 M Ω only
 Weight: 300g
 Usage Environment: Indoor
 Max. Altitude: 2000m.
 Max. relative humidity: 80% (max. 31°C)

* Note: Accuracy is specified for probe operating in fixed orientation with respect to earth's magnetic field following an auto-zero operation

SAFETY

The probe has been designed to comply with IEC1010-2-032 Installation Category (Overvoltage Category) II, 300V, Pollution Degree 1.

PERFORMANCE DATA

Typical probe amplitude and phase response

AP082 / AP083 Trigger Pick-off for SDH: STM-1E and SONET: STS-3

Main Features

- AP082 for SDH, AP083 for SONET.
- Ideal for pulse mask-testing (G.703 fig 24 and 25).
- Works with scrambled or live data streams.
- Automatic impedance matching and scaling.
- ProBus™ design, automatically sensed by the 93XX oscilloscopes.
- Includes ready-to-load G.703 masks fig. 24 and 25.

Choose to trigger on "0"s or on "1"s

155 Mbps electrical SDH and SONET signals use the CMI encoding. Using an oscilloscope to selectively trigger on the leading edge of a "1" pattern, and reject all the zeros (or vice versa) has been practically impossible until now. Thanks to its dedicated circuitry, the AP082/083 can easily isolate either

"0" or "1" patterns, allowing for further analysis such as jitter characterization or mask testing – G.703 Fig. 24 and 25 masks are supplied with the accessory.

Accurate readings

Both the AP082 and the AP083 have been designed to provide the correct impedance matching (50Ω for SONET and 75Ω for SDH) and because the accessory is automati-

cally sensed by the oscilloscope, the amplitude readings are correctly scaled on screen.

High Bandwidth

In addition, the accessory's high bandwidth make it suitable for testing with an oscilloscope of 1 GHz or greater, to minimize attenuation and distortion, and to comfortably analyze the signal well beyond its 5th harmonic.

Without the adequate triggering provided by the AP082/083, both "0" and "1" patterns overlap.

The same signal as in column 1, but with AP082/083 trigger set to trigger on a "0" pattern.

The same signal as in column 1, but with AP082/083 trigger set to trigger on a "1" pattern.

Specifications

AP082

Bandwidth (3 dB): 1 GHz

Input range: $\pm 2V$

Input coupling: DC

Input impedance: 75Ω

Trigger output impedance: 50Ω

Trigger output range: $\pm 300mV$

AP083

Bandwidth (3 dB): 1 GHz

Input range: $\pm 2V$

Input coupling: DC

Input impedance: 50Ω

Trigger output impedance: 50Ω

Trigger output range: $\pm 300mV$

Ordering Information

AP082 SDH: STM-1E trigger pick-off with SDH masks on 3.5" Floppy disk.

AP083 SONET: STS-3 trigger pick-off with SONET masks on 3.5" Floppy disk.

The Digital Scope Specialists

WP01 Waveform Processing Firmware for the 9300 Family of Digital Oscilloscopes

Main Features

- High-precision averaging up to 1 million sweeps
- Extended digital filtering capabilities
- Rescale function, with $(ax + b)$ correction factor
- Envelope mode
- Integration
- Differentiation
- $\log(e)$ and $\log(10)$
- $\exp(e)$ and $\exp(10)$
- Absolute, Reciprocal
- Square, Square root
- Powerful function chaining feature

Summed Averaging is applied to the signal in Channel 1, to remove random noise. Trace A shows the result after 377 sweeps: the noise has practically disappeared.

The LeCroy WP01 Waveform Processing package features a powerful toolset that extends the processing power inside the 9300 oscilloscope, well beyond the capabilities of a traditional instrument.

In fact, all the processing is built-in to eliminate the need for external computers and controllers. High-speed microprocessors are used to ensure real-time updates of computed waveforms on the screen.

The package is fully programmable over GPIB or RS-232-C interfaces, and hard copies can be made directly on to a wide range of printers – including the optional internal printer – plotters or graphic formats.

Features and Benefits

EXTENSIVE SIGNAL AVERAGING

WP01 offers two powerful, high-speed averaging modes that can be used to reduce noise and improve the signal-to-noise ratio. Vertical resolution can be extended by several bits to improve dynamic range and increase the overall input sensitivity to as much as 50 $\mu\text{V}/\text{div}$.

Summed averaging, where up to 1,000,000 sweeps are repeatedly summed, with equal weight, in a 32-bit accumulation buffer for improved accuracy. The accumulated result is then divided by the number of sweeps.

Continuous/exponential averaging where a weighted addition of successive waveforms can be performed with weighting factors from 1:1 to 1:1023. The averaging goes on indefinitely with the contribution of "older" sweeps gradually decreasing. The method is particularly appropriate to reduce noise on signals drifting very slowly in time or amplitude.

ENHANCED RESOLUTION BY DIGITAL FILTERING

Allows low-pass F.I.R. filtering of the digitized signals, with 6 different cut-off frequencies per sampling rate setting. As a result, the vertical resolution of the captured signals – single-shot or repetitive – increases from 8 bits to 11 bits in 0.5-bit steps. This feature is a post-acquisition process which allows the user to capture, save and view the raw data as well as the processed data after applying one or more filters.

RESCALING

Allows an input signal to be rescaled using a $(ax + b)$ correction factor to compensate for gain and offset. This is very useful when dealing with various types of transducers, to read the correct temperature or pressure value directly from the scope's cursor.

High-frequency glitches in Channel 1 have been dramatically reduced in Trace A by using the low-pass filtering properties of the Enhanced Resolution Function.

ENVELOPE MODE

Shows the signal envelope by retaining only the highest and lowest amplitudes for every sampling interval, over a user-definable number of sweeps. Ideal to visualize the time or amplitude jitter in a signal.

POWERFUL MATH TOOLSET

In addition to the basic arithmetic functions found in the standard models (+, -, ×, ÷), WP01 adds an impressive set of functions such as integration, differentiation, logarithms and exponential – in both bases 10 and e – square, square root, reciprocal and absolute value.

All these functions are updated automatically each time a new waveform is acquired, showing a "live" representation of a computed trace. This would be impossible to achieve on a separate computer.

FUNCTION CHAINING

When more than one math function is needed in the equation, WP01 supports function chaining, and allows the user to multiply, for instance, the "Voltage" and the "Current" channel and to integrate the result to get an instantaneous energy curve.

REMOTE CONTROL

All of the waveform processing can be controlled via GPIB or RS-232-C remote control. And the function traces do not even need to be called up on screen to be updated, an important feature that speeds up the computation.

To illustrate WP01's function chaining ability, the noisy signal in Channel 1 has been averaged in Trace A to remove undesired noise, and the result integrated in trace B.

WP01 Specifications

GENERAL

Max. number data points: only limited by the available amount of system memory (indicated in the "memory used" status menu).

Min. number data points: Data points can be reduced down to 50 in the processing function to improve update rate.

Vertical Zoom: supported, 50x maximum.

Horizontal Zoom: supported, maximum zooming to a point where 20 samples of the source trace occupy the full screen.

Maximum Sensitivity: 50 μ V/div after vertical expansion.

SUMMATION AVERAGING

Number of Sweeps: 1 to 1,000,000.

Speed: up to 200,000 points/s.

CONTINUOUS AVERAGING

Possible Weighting Factors: 1:1, 1:3, 1:7, 1:15, 1:31, 1:63, 1:127, 1:255, 1:511 and 1:1023.

ENHANCED RESOLUTION

Choice of six low-pass filters to improve vertical resolution improvement from 8 to 11 bits in 0.5-bit steps.

Resulting bandwidth:

0.5 bit	$0.5 \times \text{Nyquist BW}$
1 bit	$0.241 \times \text{Nyquist BW}$
1.5 bit	$0.058 \times \text{Nyquist BW}$
2 bit	$0.029 \times \text{Nyquist BW}$
2.5 bit	$0.016 \times \text{Nyquist BW}$
Nyquist BW = $1/2 \times \text{sample frequency}$.	

RESCALE

ax + b rescaling with a and b ranging from $\pm 0.00001 \text{ E-15}$ to $\pm 9.99999 \text{ E+15}$

ARITHMETIC

Addition, subtraction, multiplication and ratio on any two waveforms.

FUNCTIONS

Identity, negation, integration (including additive constant), differentiation, square, square root, logarithm and exponential (base e and 10), reciprocal and absolute value of any waveform.

EXTREMA

Shows the signal envelope by retaining only the highest and lowest amplitudes for every sampling interval. Logs all extreme values of a waveform over a programmable number of sweeps. Maxima and minima can be displayed together, or separately by choosing *roof* or *floor* traces.

Number of Sweeps: 1 to 1,000,000.

FUNCTION CHAINING

Up to four functions can be automatically chained using traces A, B, C and D. Using memories M1 to M4 for intermediate results, any number of operations can be chained manually or via remote control.

REMOTE CONTROL

All controls and waveform processing functions are fully programmable using simple commands over the oscilloscope's GPIB or RS-232-C interfaces.

WP02 Spectrum Analysis Firmware for the 9300 Family of Digital Oscilloscopes

Main Features

- Frequency range from DC up to the instrument's full bandwidth
- Simultaneous FFTs on up to four channels
- Frequency resolution down to 100 μ Hz
- Frequency domain averaging
- Wide selection of scaling formats
- Five window functions
- Up to Five 1000-point FFTs per second
- Full support of cursors and automatic waveform parameters
- Full PASS/FAIL testing support

Adding the WP02 Spectrum Analysis Package to the 9300 family of digital oscilloscopes provides a fast and economical solution to frequency domain applications.

The WP02 Spectrum Analysis package provides the 9300 oscilloscope with a powerful frequency-domain toolset that extends its processing capabilities well beyond the realm of a standard instrument. In fact, all the processing is built-in to eliminate the need for external computers and controllers.

High-speed microprocessors are used to ensure real-time update of computed waveforms on the screen. Fast Fourier Transforms (FFTs) rapidly convert time domain waveforms into frequency domain records to reveal valuable spectral information such as phase, magnitude and power.

The package is fully programmable over GPIB and RS-232-C interfaces, and hardcopies can be made directly on to a wide range of printers – including the optional internal printer – plotters or graphic formats.

Features and Benefits

WHY FFT IN A SCOPE?

The FFT package on a LeCroy 9300 has at least four clear advantages over common swept spectrum analyzers:

- It can show the spectrum of a **transient signal**.
- Both **time and frequency** information can be monitored **simultaneously**.
- Phase information is **available**.
- The price is **attractive**.

It has two definite advantages over FFT analyzers:

- It can show higher-frequency components.
- Both **time and frequency** information can be monitored **simultaneously**.
- The price is **attractive**.

BROAD SPECTRUM COVERAGE

The frequency spectrum ranges from DC to the full bandwidth of the oscilloscope for repetitive signals, and to one half of the maximum sampling frequency for transients.

MULTI-CHANNEL ANALYSIS

All input channels can be analyzed simultaneously to look for common frequency-domain characteristics in independent signals.

VERSATILE SCALING FORMATS

Frequency-domain data may be presented as magnitude, phase, real, imaginary, complex, log-power and log-PSD (Power Spectral Density).

STANDARD WINDOW FUNCTIONS

Use rectangular for transient signals; von Hann (Hanning) and Hamming for continuous waveform data; Flattop for accurate amplitude measurements; Blackman-Harris for maximum frequency resolution.

FREQUENCY DOMAIN AVERAGING

Up to 50,000 FFT sweeps may be averaged to reduce base-line noise, enable analysis of phase-incoherent signals or signals which cannot be triggered on.

FREQUENCY CURSORS AND WAVEFORM PARAMETERS

Cursors can be set on the FFT trace to show up to 0.004% frequency resolution (up to 0.002% for 10,000 point memory) and measure power or voltage differences to 0.2% of full scale. Automatic waveform param-

An FFT (top trace) with spectral components buried in noise. By applying the power averaging function (lower trace), all the baseline noise is removed, and the spectral components of an AM signal are clearly visible..

eters can also be applied to FFT traces.

PASS/FAIL TESTING ON FFT TRACES

PASS/FAIL testing is fully supported on FFT traces. The instrument can be setup to test incoming spectra against tolerance masks. In case the signal "fails", the instrument can be programmed to perform a choice of actions (screen dump, waveform storage, pulse out, etc.)

RESCALING

Allows an input signal to be rescaled using a $(ax + b)$ correction factor to compensate for gain and offset. This is very useful when dealing with various types of transducers, to read the correct temperature or pressure value directly from the scope's cursor.

FUNCTION CHAINING

When more than one math function is needed in the equation, WP02 supports function chaining, and allows the user to subtract a signal from a background reference stored in memory and then perform an FFT after the subtraction.

REMOTE CONTROL

All of the waveform processing can be controlled via GPIB or RS-232-C remote control. And the function traces do not even need to be called up on screen to be updated, an important feature that speeds up the computation.

FOURIER PROCESSING

Fourier processing is a mathematical technique which enables a time-domain waveform to be described in terms of frequency-domain magnitude and phase, or real and imaginary spectra. It is used, for example, in spectral analysis where a waveform is sampled and digitized, then transformed by a Discrete Fourier Transform (DFT). Fast Fourier Transforms (FFT) are a set of algorithms used to reduce the computation time (by better than a factor of 100 for a 1000 point FFT) needed to evaluate a DFT.

WP02 Specifications

GENERAL

Max. number data points: only limited by the available amount of system memory (indicated in the "memory used" status menu).

Min. number data points: Data points can be reduced down to 50 in the processing function to improve update rate.

Vertical Zoom: supported, 50x maximum.

Horizontal Zoom: supported, maximum zooming to a point where 20 samples of the source trace occupy the full screen.

Maximum Sensitivity: 50 $\mu\text{V}/\text{div}$ after vertical expansion.

Frequency Range:

Repetitive signals: DC to instrument bandwidth.

Transient signals: DC to 1/2 maximum single-shot sampling frequency

Frequency Scale Factors: 0.05 Hz/div to 0.2 GHz/div in a 1-2-5 sequence.

Frequency Accuracy: 0.01%.

AMPLITUDE AND PHASE

Amplitude Accuracy: Better than 2%. Amplitude accuracy may be modified by the window function (see the window functions table).

Signal Overflow: A warning is provided at the top of the display when the input signal exceeds the ADC range.

Number of Traces: Time domain and frequency domain data can be displayed simultaneously (up to 4 waveforms).

Phase Range: -180° to $+180^\circ$.

Phase Accuracy: $\pm 5^\circ$ (for amplitudes > 1.4 div).

Phase Scale Factor: $50^\circ/\text{division}$.

SPECTRUM SCALING FORMATS

Horizontal Scale: Linear, in Hz

Vertical Scales:

Power Spectrum in dBm (1 mW into 50 Ω).

Power Spectral Density (PSD) in dBm.

Magnitude, Real, Imaginary: Linear, in V/div

Phase Display: Linear, in degrees.

WINDOW FUNCTIONS

Rectangular, von Hann (Hanning), Hamming, Flattop and Blackman-Harris (see table below).

FFT EXECUTION TIMES*

100 points in less than 0.03 s.

1000 points in less than 0.3 s.

10000 points in less than 3 s.

* Only valid for 9370, 9350, 9360, and 9304/10 with MWP option. Other models, add 50%

FREQUENCY DOMAIN POWER AVERAGING

Summation averaging of power, PSD or magnitude for up to 50,000 sweeps.

FUNCTION CHAINING

Up to four functions can be automatically chained using traces A, B, C and D. Using memories M1 to M4 for intermediate results, any number of operations can be chained manually or via remote control.

REMOTE CONTROL

All controls and waveform processing functions are fully programmable using simple commands over the oscilloscope's GPIB or RS-232-C interfaces.

FILTER PASS BAND AND RESOLUTION

Window type	Filter bandwidth at -6 dB [freq. bins]	Highest side lobe [dB]	Scallop loss [dB]	Noise bandwidth [freq. bins]
Rectangular	1.21	-13	3.92	1.0
von Hann	2.00	-32	1.42	1.5
Hamming	1.81	-43	1.78	1.36
Flattop	1.78	-44	0.01	2.96
Blackman-Harris	1.81	-67	1.13	1.71

Filter Bandwidth at -6 dB characterizes the frequency resolution of the filter.

Highest Side Lobe indicates the reduction in leakage of signal components into neighboring frequency bins.

Scallop Loss is the loss associated with the picket fence effect.

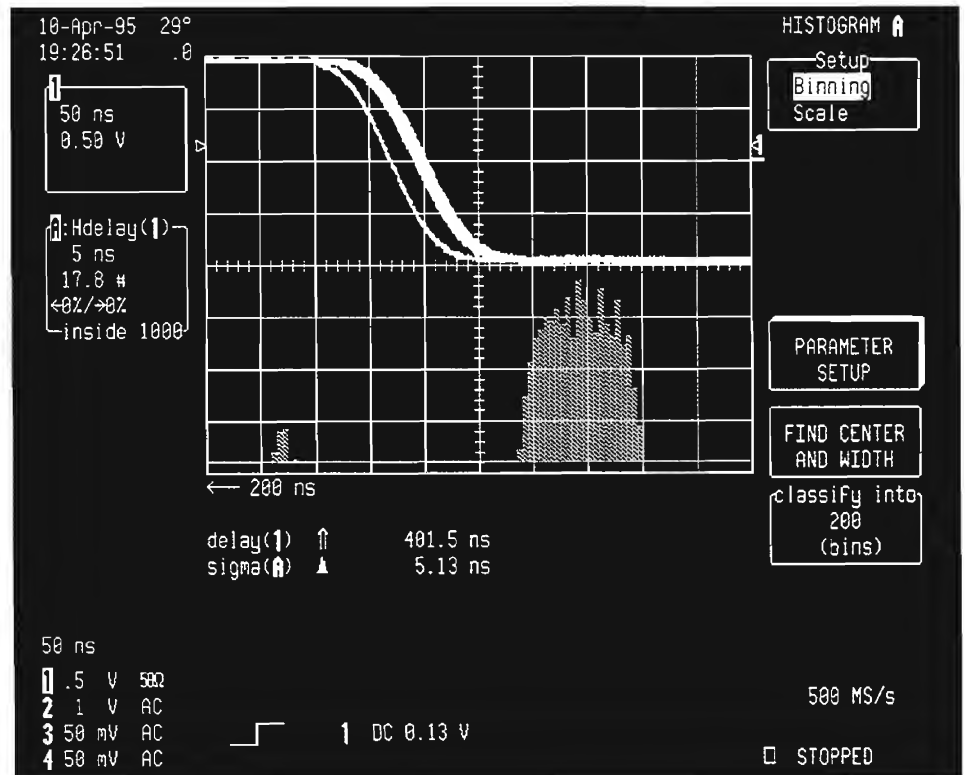

LeCroy
Innovators in Instrumentation

WP03 Parameter Distribution Analysis Firmware for the 9300 Family of Digital Oscilloscopes

Main Features

- Histogram function of over 40 different parameters
- Up to 2000 bins
- Population of up to 2,000,000,000
- 18 histogram parameters
- Autoscale on Histogram
- Histograms of all or individual segments in sequence waveforms

Parameter Histogram Display shows the statistical distribution of timing jitter.

The LeCroy WP03 Waveform Processing package extends the measurement capability of the 9300 oscilloscope by providing a new processing function – *built into the oscilloscope* – to perform in-depth statistical analysis of waveform parameters – a task that was formerly carried out either manually, with a notepad, or by means of an external computer, in a spreadsheet program.

The new function provides **histogramming** of any waveform parameter measurement, and can be conveniently **autoscaled** to display the center and width of the distribution. In addition, an already wide range of automated measurements are extended to provide a new category of statistical measurements specifically designed to analyze histogram distributions.

The package is fully programmable over GPIB and RS-232-C interfaces, and hardcopies can be made directly to a wide range of printers (including the optional internal printer), plotters or graphic formats.

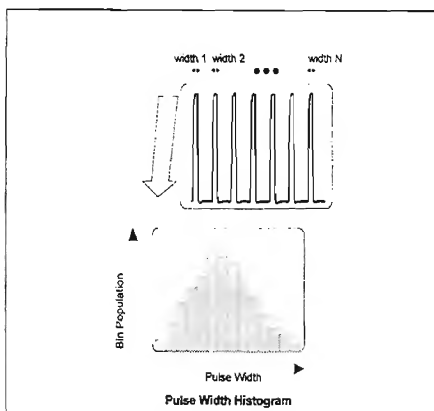

WAVEFORM PARAMETER ANALYSIS

WP03 adds a powerful dimension to waveform analysis by recording and analyzing the properties of a series of waveform parameter measurements. This is accomplished by a function that records the parameter values and presents the data in a statistical form – the Histogram.

The Histogram function produces a waveform consisting of one point for each histogram bin, where the value of each point is equal to the number of parameter values which fall into the corresponding bin. Analysis of histogram distributions is supported by a wide range of automated statistical parameters, which provide insight and quantitative analysis into difficult-to-measure phenomena such as jitter and amplitude fluctuation. This function is also invaluable in establishing production test limits.

A DATABASE IN THE OSCILLOSCOPE

The Histogram function performs calculations on a stored **history database** of waveform parameter values. This allows

Histogram of a pulse width parameter recorded on a single or sequence acquisition with N occurrences of the parameter

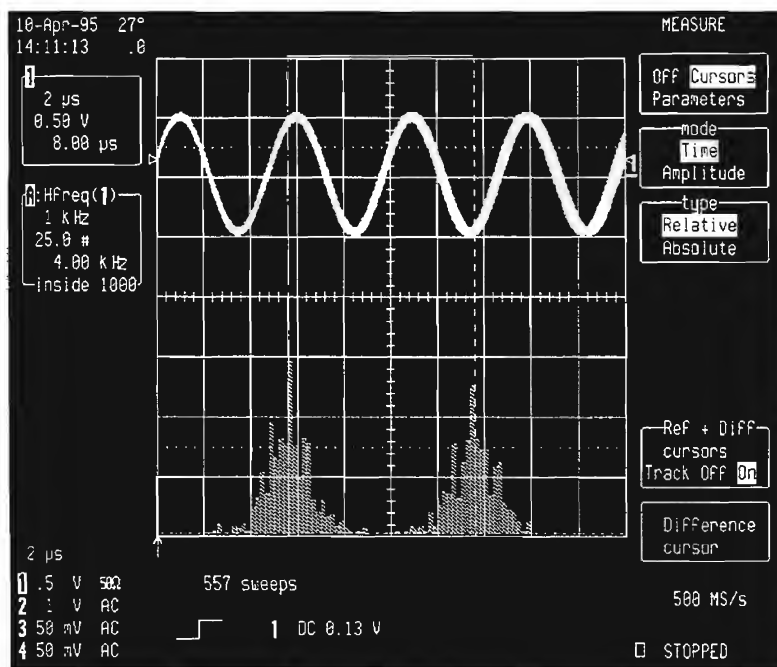

detailed analysis to be performed on parameter data without the need to reacquire the source waveforms. Having the parameter database available also allows automatic scaling of histogram and graph displays.

WAVEFORM PARAMETER MEASUREMENTS

The LeCroy 9300 series has the capability to perform a wide range of automated waveform parameter measurements which make interpretation of waveform data easy, accurate and repeatable. The distribution of these parameter measurements can be analyzed by histogramming their values.

Some of the waveform parameters available include:

amplitude	Δt at level (abs)	overshoot+
area	Δt at level (%)	overshoot -
base	duty cycle	peak to peak
cmean	falltime	period
cmedian	f80-20%	rissetime
crms	f@level (abs)	r20-80%
csdev	f@level (%)	r@level (abs)
cycles	frequency	r@level (%)
delay	maximum	RMS
Δ delay	mean	std dev
Δt at level (abs)	median	top
Δt at level (%)	minimum	width

The upper trace shows a persistence display of a signal. A casual observer would assume there is some frequency drift. The histogram of frequencies in the lower display reveals much more detail. There are two dominant frequencies separated by 2 kHz. All scopes can measure frequency (and other parameters). The benefit of LeCroy's WP03 is that it presents the information in a way which will help the observer understand and solve problems faster.

WP03 Specifications

HISTOGRAM FEATURES

Provided below are just some of the histogramming capabilities.

Vertical:

Autoscaling, choice of "Linear", "Log" or "Constant maximum" (linear) scales. Up to 50x expansion.

Horizontal:

20 to 2000 bins in a 1–2–5 sequence.
Autosetup of center and width.

Population:

20 to 2,000,000,000 selectable in a 1–2–5 sequence.

Data Source: Any waveform parameter.

Value:

The number of events binned, as well as the percent of overflow/underflow events are automatically displayed.

Measurements: 18 Statistical parameters operate directly on the histogram.

Cursor measurements can also be made directly on histograms.

Histogram Parameters

The standard 9300 series offers basic parameter statistics (maximum, minimum, average and standard deviation). WP03 adds 18 Parameters for use directly on the histogram displays. These additional measurements allow detailed analysis of the parameter distributions and can be monitored by the pass/fail system to provide go/no-go testing based on parameter statistics.

HISTOGRAM PARAMETERS

Parameter	Abbreviation	Explanation
histogram base	hbase	Horizontal position of left-most statistically significant bin.
histogram top	htop	Horizontal position of right-most statistically significant bin.
histogram amplitude	hampl	Horizontal difference between the htop and hbase values.
histogram rms value	hrms	Root Mean Square value of histogram distribution
sigma	sigma	Standard Deviation of histogram distribution
low	low	Horizontal position of left-most non-zero bin.
high	high	Horizontal position of right-most non-zero bin.
range	range	Horizontal difference between the high and low values.
total population	totp	Total population in the histogram.
maximum population	maxp	Maximum population in any histogram bin (i.e. vertical value at the mode).
peaks	pks	Number of peaks in the distribution.
mode	mode	Horizontal position of the bin with the maximum population.
average	avg	Horizontal mean of the distribution.
median	median	Horizontal median of distribution. The value of the mid-point of the distribution.
full width at half max	fwhm	The width of the distribution around the maximum population bin, including bins which contain at least one half of the maximum population.
full width at x% of max	fwxx	The width of the distribution around the maximum population bin, including bins which are at least x% of the maximum population.
x position at peak	xapk	Horizontal position of the nth largest peak by area.
percentile	pctl	Value in histograms for which % of population is smaller.

9300 Family Disk Drive Measurement Packages

Main Features

■ IDEMA Test Standards Measurements

Pulse Width 50
Track Average Amplitude
Resolution
Overwrite

■ PRML Measurements

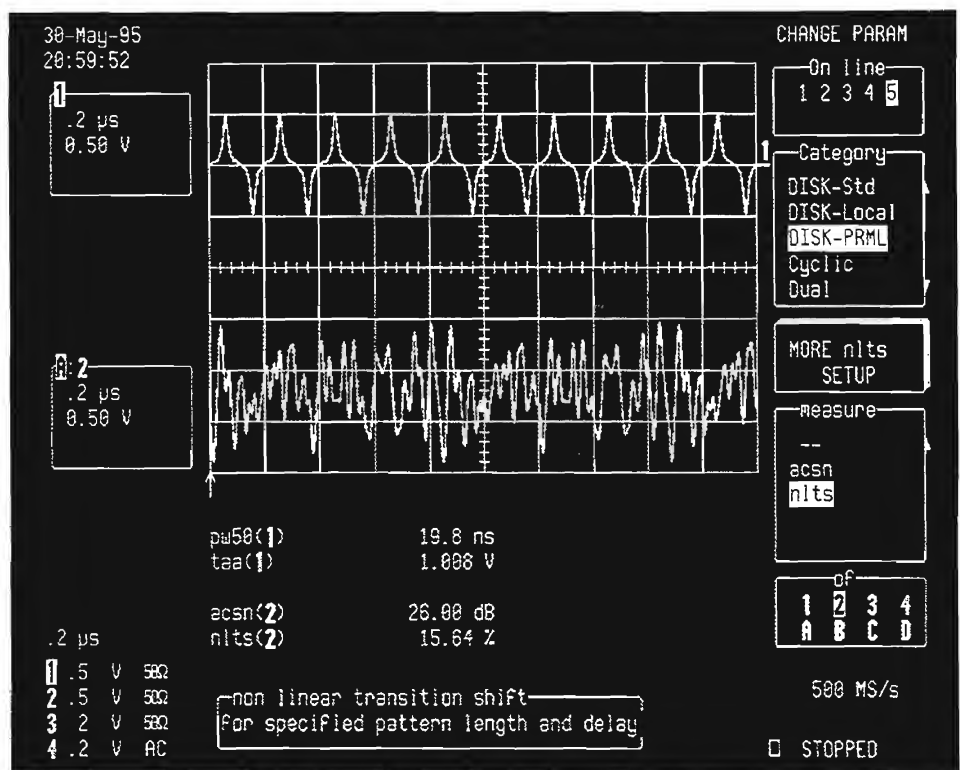

Non Linear Transition Shift
Auto Correlation Signal-To-Noise
Auto Correlation

■ Peak/Trough Pair Measurements

Time between peaks
Time between troughs
Time over threshold
And ten others...

■ Histograms for Statistical Analysis

Histograms provide bar charts for easy analysis of measurement results over many events.

DISK DRIVE MEASUREMENT PACKAGES

LeCroy's Disk Drive Measurement Packages provide the ability to perform automated drive waveform measurements. The combination of automated measurements, long memory, and waveform display enables previously unavailable drive analysis capabilities.

The Disk Drive Measurement Packages include the DDM package and the PRML package. The DDM package provides IDEMA Test methods measurements and many other measurements for analysis of Lorentzian signals. The PRML package provides parameter measurements specifically for PRML

signals including PR4, EPR4 and E²PR4.

Also provided with the DDM package is a powerful histogram math function capability. The histogram math function allows any drive waveform parameter to be histogrammed and statistically analyzed.

DDM (Disk Drive Measurement) PACKAGE

IDEMA® TEST METHODS PARAMETERS

The DDM package includes processing functions specified in the International Disk Drive Equipment and Materials Association (IDEMA®) test standards document*.

Parameter	Description
PW50 ⁽¹⁾	Pulse Width 50: Provides an average pulse width, measured at 50% peak amplitude, of all peak/trough pairs in the specified waveform.
PW50(+)	Pulse Width 50 (+): Provides an average pulse width, measured at 50% peak amplitude, of all peaks in the specified waveform.
PW50 (-)	Pulse Width 50 (-): Provides an average pulse width, measured at 50% peak amplitude, of all troughs in the specified waveform.
TAA \pm^{∞}	Track Average Amplitude: Provides an average peak-to-peak amplitude of all Peak/Trough pairs in the specified waveform.
TAA (+)	Track Average Amplitude (+): Provides an average peak amplitude of all peaks in the specified waveform.
TAA (-)	Track Average Amplitude (-): Provides an average peak amplitude of all troughs in the specified waveform.
RESOLUTION ⁽³⁾	Specified as $(TAA(F1)/TAA(F2)) * 100\%$ Where: F1 = Low Frequency F2 = High Frequency
OW ⁽⁴⁾	Overwrite: Specified as: $10 \log (V_r/V_o)$ Where: V_r is the residual V_{rms} of F1 (low frequency) after F2 (high frequency) write V_o is the V_{rms} of F1 (low frequency) after F1 write.

PEAK/TROUGH PAIR PARAMETERS

Parameters that measure amplitude and timing relationships between positive peaks and negative peaks (troughs) of a waveform are also included in the DDM package. Used in conjunction with the Histogram processing function a statistical description of the waveform can be calculated.

Parameter	Description
lbase	local baseline
lbsep	local baseline separation
lmax	peak maximum voltage
lmin	trough minimum voltage
lnum	number of local peak and trough pairs.
lpp	peak to trough amplitude ($lmax - lmin$)
ltbe	time between events (either peak to trough or trough to peak)
ltbp	time between peaks
ltbt	time between troughs
ltmn	time at minimum trough voltage
ltmw	time at maximum peak voltage
ltot	width of peak over threshold
ltpt	time between peak and trough
lttp	time between trough and peak
ltut	width of trough under threshold

*As specified in IDEMA Standards,
1994 Revised Edition

(1) Document No. T15-91

(2) Document No. T3-91

(3) Document No. T4-91

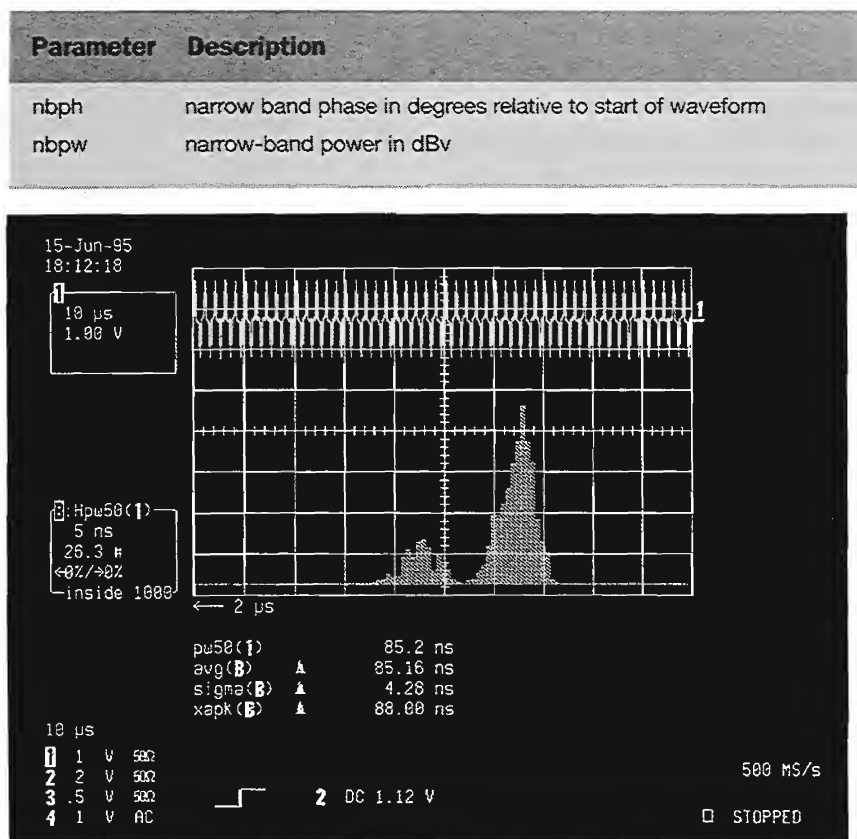

(4) Document No. T14-91

FREQUENCY DOMAIN PARAMETERS

These parameters provide a rapid technique to extract amplitude and phase of single frequencies from complex waveforms. These parameters are more efficient than using an FFT for specific frequencies of interest.

Histograms

Any waveform parameter may be histogrammed. The histogram function produces a waveform with the vertical axis in units of 'Events' and the horizontal axis in parameter units (volts, nanoseconds,etc.). The histogram shows the statistical variation of the selected parameter and is an extremely valuable analysis tool. Using scope measurement cursors the value and population of any bin can be exactly determined.

Histogram of PW50 for Trace 1 Signal

HISTOGRAM PARAMETERS

Histogram parameters provide the ability to obtain numeric values for statistics or other features of a histogram. When combined with the 9300 family parameter cursors the statistics or other characteristics of a selected section of interest in a histogram can be measured.

Name	Description
Low	Minimum value
High	Maximum value
Range	High - Low
FWHM	Width of largest peak at half amplitude
Maxp	Highest population (vertical value) in the histogram
Average	Mean value
Sigma	Standard deviation
Tpop	Total Population
XAPK	Horizontal position of the selected peak
Pks	Total number of peaks
Median	Horizontal position of the value which divides the histogram into two equal populations
Mode	Horizontal position of the most frequently occurring value
Percentile	Horizontal position separating histogram population to specified % on left such that the population on the left is a specified percentage of the total.

PRML Measurement Package

PRML PARAMETERS

PRML (Partial Response Maximum Likelihood) recording channels provide higher areal densities by allowing magnetic transitions to be written at closer spacing than peak detection channels. The following parameters provide a time domain technique to measure the time shift and S/N ratio created by this magnetic writing process.

Name	Description
NLTS	Non-Linear Transition Shift: NLTS = -200*r Where r = auto correlation coefficient @ time delay
ACSN	Auto Correlation Signal-to-Noise Ratio: ACSN = 10 log (R/1-R) Where R = correlation coefficient
AutoCorrelation $R_x(u) = \int f_x(t)f_x(t-u)dt$

9300 Family Optical-Recording Measurement Package

Main Features

Optical Recording Applications

- CD-ROM
- Magnetic-Optical
- DVD

Optical Recording Parameters

Sixteen optical-recording specific measurements including pit width, time from pit edge to clock, resolution...

List by nT Display Mode

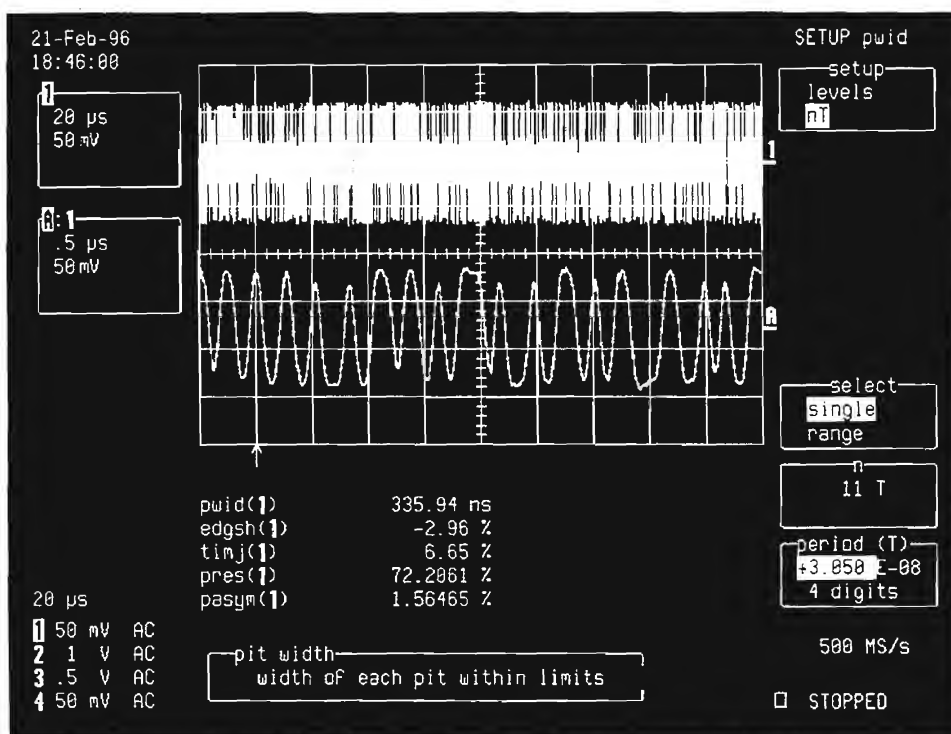

Display a list of optical-recording measurement values indexed by each (nT) pulse width.

Histograms of Measurements

Generate histogram bar charts for analysis of parameter value distributions.

Trend Analysis of Measurements

Generate trend lines of parameter measurement values to study sector variations, modulation and other time ordered dependencies.

Trace 1 is a captured CD waveform. Trace A is a zoom expansion of Trace 1. Measurements performed on Trace 1 are Pit Width (pwid), Edge Shift (edgsh), Resolution (pres) and Pit Asymmetry (pasym).

Optical Recording Measurement Package

LeCroy's Optical Recording Measurement Package provides the ability to perform automated measurements of optically recorded data waveforms. The combination of automated optical recording measurements, long DSO memory, advanced triggering features and a large screen waveform display provides previously unavailable optical recording analysis capabilities.

Sixteen optical-recording waveform specific parameter measurements are provided.

Up to five different parameter values can be displayed simultaneously with statistics such as average, maximum, minimum and sigma.

Also provided is a unique "List by nT" display mode, which simultaneously provides for each group of 'nT' width pits/spaces, the values of measurements such as edge shift, timing jitter, etc.

Histogram graphs of parameter measurements can be selected to observe statistical anomalies not normally identifiable by calculating, for example, a parameter's average or sigma.

Trend graphs of parameter measurements can also be selected to observe the variation of successive parameter measurements within a sector or even around a track.

OPTICAL RECORDING PARAMETERS

Optical Recording Measurement Package parameters directly support the pit/space width based data encoding mechanism used in optical recording, by pre-screening waveform pits and spaces into width ranges of $1T \pm .5T$, $2T \pm .5T$, ..., $jT \pm .5T$ where T is the clock period.

User options include the ability to:

- calculate parameter values for pits, spaces or both.
- calculate parameter values for pits and/or spaces of a specific 'nT' value or range of 'nT' values.
- set the voltage threshold level at which to measure pits/spaces widths.

and many more....

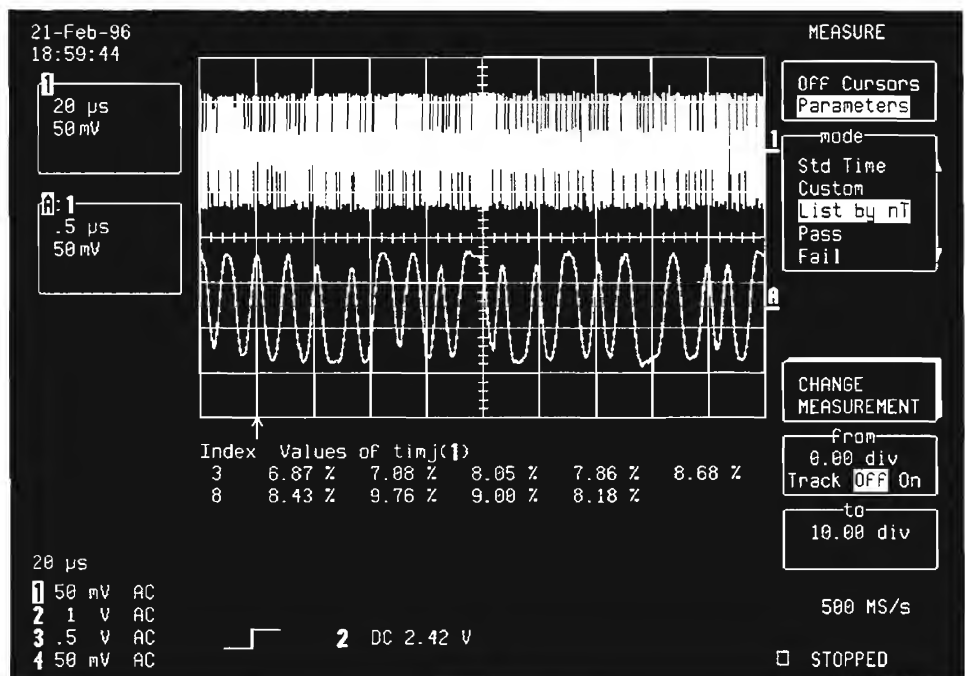

Parameter Description

$\Delta p2cl$	Delta Pit to Clock - time between pit or space edges and the next clock edge normalized by the clock period.
$\Delta p2cs$	Delta Pit to Clock Sigma - standard deviation of time between pit or space edges and the next clock period, normalized by the clock period.
edgsh	Edge Shift - the mean value of the difference between pits or space widths and their ideal widths.
paa	Pit Average Amplitude - average amplitude of pits.
pasym	Pit Asymmetry - ratio of the difference between the amplitude of the largest 'nT' width pits and the smallest 'nT' width pits to the amplitude of the largest 'nT' width pits.
pbase	Pit Base - the value for the base level of a space.
pmidl	Pit Middle - the midpoint between the top and base of pits.
pmax	Pit Max - the maximum value of a pit.
pmin	Pit Min - the minimum value of a space.
pmoda	Pit Modulation Amplitude - ratio of the amplitude of pits of the smallest 'nT' width to the top of pits of the largest 'nT' width.
pnum	Pit Number - total number of pits and/or spaces in a waveform.
pres	Pit Resolution - ratio of the amplitude of pits of the smallest 'nT' width to pits of the largest 'nT' width.
ptop	Pit Top - the value for the top level of a pit space.
pwid	Pit Width - the width of pits and/or spaces measured at a user defined threshold.
t@pit	Time at Bit - time of occurrence of pits/spaces.
timj	Timing Jitter - the standard deviation of the difference between pit and/or space widths and their ideal widths.

OPTICAL RECORDING 'List by nT' DISPLAY MODE

Often it is desirable to view a measurement value for each 'n' value for all possible 'nT' width ranges simultaneously. The List by nT display is provided to accommodate this need. Up to 25 'nT' values can be displayed simultaneously in this mode. Measurements that can be displayed in the List by nT mode are:

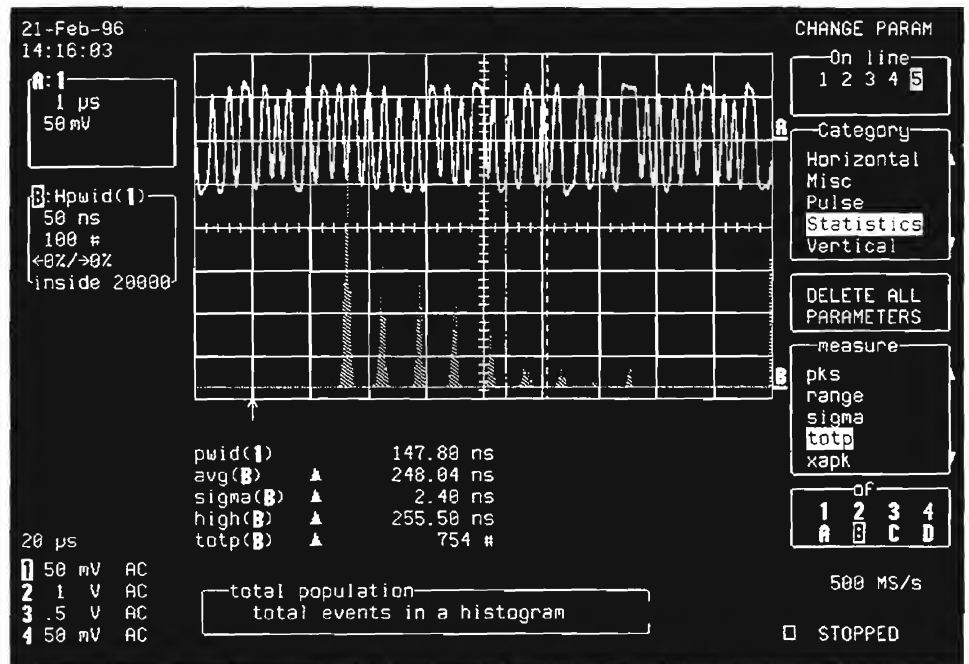

- Time from Pit to Clock
- Sigma of Time from Pit to Clock
- Pit Width
- Edge Shift
- Timing Jitter
- Pit Top
- Pit Base
- Pit Maximum
- Pit Minimum
- Pit Number
- Pit Average Amplitude

List by nT mode display of Timing Jitter (timj) measurement of CD-ROM Data Waveform with separate values displayed for each 'nT' pit/space width (3T-11T)

HISTOGRAM FUNCTION

A histogram of any waveform parameter measurement can be displayed. The histogram function produces a bar graph with the vertical axis in units of 'Events' and the horizontal axis in the unit of the parameter being histogrammed (i.e., volts, nanoseconds, etc.). Histograms graphically represent the distribution of parameter measurements providing insights often not available through standard statistical measurements such as the average and standard deviation.

CD-ROM Data Waveform with Histogram of Pit Width (pwid) parameter. Notice the distinct peaks resulting from pits/spaces all being an integral number of clock periods in width. Statistical analysis of histograms is performed using histogram parameters. For the above figure the histogram peak representing 8T pits and spaces is selected using the vertical cursor lines and the average (avg), sigma, highest value and population of the peak (ttop) are displayed.

HISTOGRAM PARAMETERS

Histogram parameters provide the ability to obtain numeric values for the statistics or other features of a histogram distribution. When combined with the 9300 family parameter cursors the statistics or other characteristics of a selected section of interest in a histogram, such as a specific histogram peak, can be directly measured.

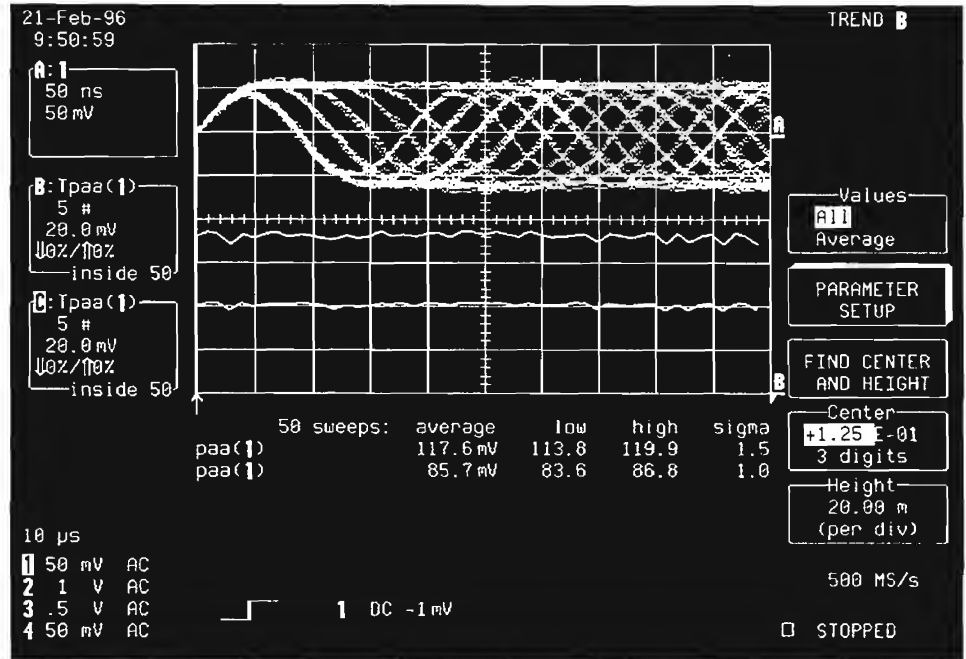

Parameter Description

Low	Minimum horizontal axis value in a histogram.
High	Maximum horizontal axis value in a histogram.
Range	High - Low.
FWHM	The width of the largest peak in a histogram at half the peak's amplitude.
Maxp	Population of the highest bin in a histogram.
Average	The mean value of a histogram.
Sigma	The standard deviation of the values in a histogram.
Ttop	The total number of parameter measurement values displayed in a histogram.
XAPK	The horizontal axis value of the selected histogram peak.
Pks	The number of distinct peaks (modes) in a histogram.
Median	The horizontal axis value which divides the histogram population into two equal populations.
Mode	The horizontal axis value of the most populated histogram bin.
Percentile	Horizontal position separating a histogram population such that the population on the left is equal to the selected percentile of the total population.

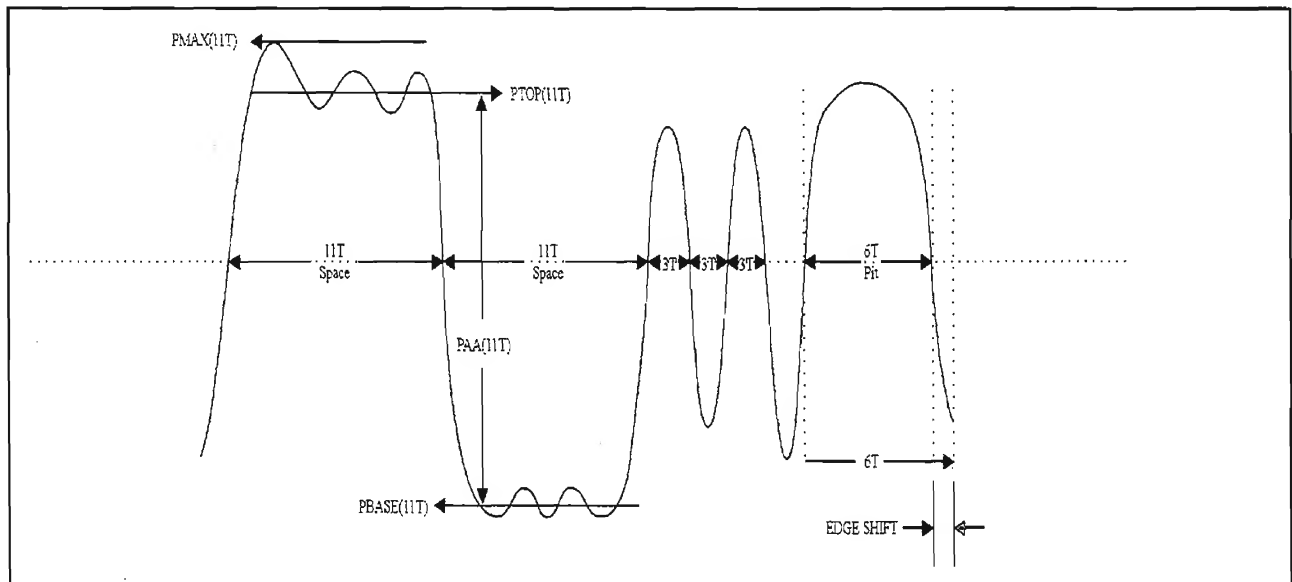

TREND FUNCTION

A graph of successive values of any waveform parameter measurement may be generated through the Trend function. The Trend function produces a line graph with the vertical axis representing the values of parameter measurements and the horizontal axis the rank order number (i.e., first parameter measurement calculated, second parameter...) in which each parameter value displayed was calculated.

The trend function provides instant insight about the variation of a selected waveform attribute for successive parameter measurement calculations. This is particularly useful when trying to determine the modulation of a track or other time or position based variations of interest.

Trace A shows an eye diagram of a CD signal. Trace B is a trend of the Pit Amplitude of 11T pits and Trace C is a trend of the Pit Amplitude of 3T pits. Notice the similarity of the variation in the two trends lines indicating that some of the variation is due to a common source.

TC1 - CCITT, ANSI and ISDN Telecommunications Test Masks

Main Features

- 25 standard telecom signal masks including SDH and SONET
- Available on 3.5" DOS floppy or PCMCIA memory card
- Up to 4 different pulses can be tested simultaneously
- Allows combination of mask and pulse-parameter testing
- Actions such as Storage, Hardcopy, Beeping, or TTL pulse can be carried out when signal fails

Now you can make telecom pulse-shape measurements to CCITT, ANSI and ISDN standards without using Mylar overlays. LeCroy TC1 automates the mask measurements that are so time-consuming with analog oscilloscopes. In addition the computed Pass/Fail test brings accuracy and repeatability to what used to be simple eyeballing. Human errors can therefore be significantly minimized. And when the test fails, actions such as a TTL pulse output

can drive another test device, eliminating the need for developing costly software for production test. The test masks are available on a PCMCIA memory card or a 3.5" DOS floppy disk. That means they can be used on any LeCroy 9300 or 9400 oscilloscope carrying either option, eliminating the need for costly factory retrofits. Just plug in the card or floppy and turn your LeCroy oscilloscope into a Telecom Physical-Layer Tester.

The AP082/83 trigger pick-offs can trigger on scrambled SDH/SONET data streams.

Features and Benefits

WIDE RANGE OF TELECOM MASKS

TC1 provides a total of 25 masks:

- 6 from ANSI T1.102-1987
- 19 from CCITT G.703
- 2 from the ISDN I.403

EASY INSTALLATION

Simply transfer the requested template from the TC1 card or disk to the scope's internal memory and you are ready for testing.

EASY TO USE

Use the built-in Pass/Fail utility to set the oscilloscope to Fail as soon as the acquired signal leaves the mask, then start the acquisition.

CUSTOM TOLERANCES

Masks can be customized by adding extra vertical or horizontal tolerances.

FLEXIBLE TEST ROUTINES

Up to 4 different mask tests can be carried out at the same time. They can also be combined with pulse parameter tests chosen from a list of 32 (rise-time, frequency, amplitude etc.).

FLEXIBLE ACTIONS

If the signal fails, the user can select any of the following procedures:

- Stop the acquisition and show the failed trace.
- Store the signal in internal memory.

- Store the signal on the PCMCIA memory card.
- Store the signal on the 3.5" DOS floppy disk.
- Make a screen dump to a printer or plotter, or to the card/disk for future use in your word processor.
- Generate a "beep".
- Send a TTL pulse from the "CAL OUT" BNC connector.
- Send an SRQ to the GPIB port.

Ordering Information

93XX-MC-TC1 Telecom Templates on a 512K PCMCIA card. Requires the 93XX-MC01/04 card-reader option.

93XX-FD-TC1 Telecom Templates on a 3.5" DOS floppy disk. Requires the 93XX-FD floppy-drive option.

PP 090 75 Ω to 50 Ω ProBus Adaptor

AP082 SDH: STM-1E trigger pick-off with SDH masks on 3.5" Floppy disk.

AP083 SONET: STS-3 trigger pick-off with SONET masks on 3.5" Floppy disk.

930x-64

64 Mega Bytes Extended Processing Memory

Main Features

- Extended memory capacity for processing long waveforms.
- High-speed signal processing.
- Fast Fourier Transforms on long waveforms.
- Improved trace update rate.

Power and Speed

This option offers 64 Mbytes of processing RAM for the 9300 series of DSOs that have a 68030 processor installed. One benefit of the 64 Mbyte option is its ability to handle longer FFTs, multiple zooms, math function chaining, and storage of very long waveforms. In addition to increased capability for memory intensive applications the extra memory results in higher processing speed for all operations.

Memory Usage

In a typical 9300 series oscilloscope about 1.5 MB of RAM is used by the operating system and the remainder (2.5 MB for standard models, 6.5 MB for 'M' models and 14.5 MB for 'L' models) is available for waveform processing. The amount of memory needed depends on the length of waveforms being processed. For example, performing a simple function on a 1 million point waveform requires 4 Mbytes, performing an FFT on a 1 million point signal requires 8 Mbytes.

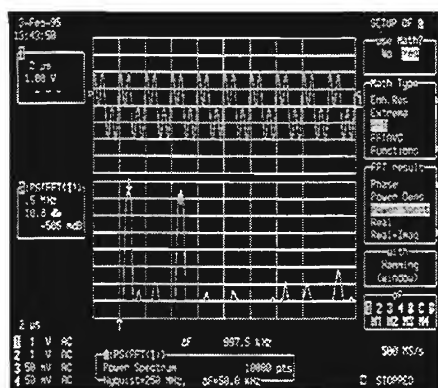

Enough Memory?

Without sufficient processing memory users can run into application problems. Two 2 million point signals may be stored in the RAM of an 'L' model DSO but an additional oscilloscope operation may demand more than the remaining available RAM. The result is memory crunch, and the scope slows down. The 64 Mbyte option gives 'power users' the capability they need to ensure that processing of long waveforms does not cause a problem.

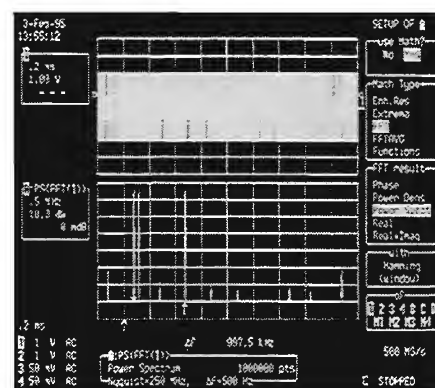

Memory for Analysis

LeCroy high performance DSOs (9350 and 9370 series) can acquire signals of 8 million points and process them with calculations including integration, differentiation, FFT, square-root, log, exponential and six selectable digital filters using the 64 Mbytes of RAM. The benefit to the user is more accurate measurements with better resolution.

An FFT is a complex calculation which requires up to 10 bytes of processing RAM for each point of signal data. One approach to this computational challenge is to reduce the number of points used in the FFT calculation, to use only the first 10 k for example. This compromise can lead to inaccurate analysis and wrong results. With extra RAM FFT calculations can be performed on waveforms of several million points without loss of accuracy.

Displayed above is a waveform and an FFT performed on its first 10,000 points. Its resolution is 50 kHz.

Extended processing memory allows FFTs to be performed quickly on signals of several million points. Above is an FFT of the same signal with 1,000,000 points captured and analyzed. Note that the initial peak of the first screen (left) is resolved into two peaks (above) and that the frequency resolution is now 500 Hz. A DSO with long FFT capability shows more detail and allows more precise measurements in the frequency domain.

Memory Utilization Table

	Record Length			
	1	2	4	8
Store to each of M1 to M4	2	5	10	20
Simple function (e.g. log)	4	10	20	40
Add/sub/mult/div 2 signals	6	15	30	60
Summed Average	8	20	40	80
FFT	8	20	40	80

Memory in Mbytes

This table outlines the memory utilization for computation intensive signal processing. For example, the total processing memory required to perform an FFT on a 4 million point waveform is 40 Mbytes.

Ordering Information

930x-64 Option for:
935X
937X

It is also possible to add the 64 Mbyte option to the 930X and 931X series of DSOs if they have already been upgraded with the MWP option but this would be an unlikely requirement due to the length of the acquisition memory of these oscilloscopes.

CKTRIG hardware option for the 9350A and 9370 series oscilloscopes

Main Features

- High speed 500 MHz external clock input.
- 10 MHz external clock reference input.
- Edge trigger comparator output.
- BNC, rear-panel mounted connectors.

External clock

This feature allows the 9350A and 9370 series DSOs to be externally clocked at a fixed rate from 50 MS/s to 500 MS/s, enabling full phase control over the acquired signal. The sample rate can be fine-tuned to the exact speed required by the application.

External reference

The external reference allows the scope to be phase-synchronized to an external 10 MHz reference, either to match the stability of the external source or to phase lock the acquired signal. Several DSOs can then be synchronized using a simple source as reference.

Trigger comparator

The trigger comparator signal outputs a pulse for each valid edge-trigger condition on the trigger signal. This is an invaluable feature for event-counting and throughput applications.

Specifications

EXTERNAL CLOCK INPUT

Input signal requirements:

Amplitude: 800 mV p-p
Frequency range: 50 MHz to 500 MHz
Offset: 0 V

Input impedance: 50Ω.
Calibration must be initiated for each external clock change.

**The negative pulse width must be less than 5ns.
(2ns recommended)**

Swept Clock: Only a fixed frequency external clock is supported. Swept clocks will cause severe offset errors (10% worst-case).

EXTERNAL CLOCK REFERENCE INPUT

Input signal requirements:

Amplitude: 800 mV p-p
Frequency range: 10 MHz $\pm 5\%$
Offset: 0 V

Input impedance: 50Ω.

TRIGGER COMPARATOR OUTPUT

The comparator operates in a 'time-over-threshold' mode and generates a pulse edge of the same polarity as the polarity of the selected triggering edge each time a valid EDGE TRIGGER condition is met on the trigger signal. The duration of the pulse will be equal to the time the trigger signal is above/below the trigger level.

Note: This does not operate in SMART TRIGGER mode.

Output signal characteristics: ECL, 50Ω, series-terminated.

LeCalsoft—Calibration Software for LeCroy Digital Oscilloscopes

Main Features

- Traceability to reference standards
- Computer check of key specifications
- Computer-aided readjustment
- Fully automated configurations available
- Supports all 93XX and 94XX models
- IBM® PC-AT compatible

The LeCalsoft package enables a fast and thorough verification of all key specifications.

General

The LeCroy LeCalsoft (94XXCS05) test and calibration package provides a convenient, unambiguous check of LeCroy oscilloscopes. Designed for users who require traceability to reference standards (NIST, etc.), this package is ideally suited for use in calibration laboratories where the oscilloscopes are checked at fixed intervals.

Results of the calibration check are fully documented on hard copy, or they can be archived on hard disk or diskette.

LeCalsoft works on any PC compatible with the IBM®-AT standard. It controls the oscilloscope and the calibration sources through a National Instruments® GPIB interface.

Features

Calibration Check

All the essential specifications of the Digital Oscilloscope, such as bandwidth, linearity, noise, trigger, timebase and effective-bit count are tested. Deviations from nominal values are calculated and displayed on the screen, printed, or archived on hard disk or diskette.

Comprehensive Documentation of the Test Results

At the end of each calibration check, two types of documentation are available: a long form printout which gives details of the results of all the tests executed, and states whether or not the results are within the specifications, and a short form printout which gives a summary of the test results.

Calibration Traceable to National Standards (NIST, etc.)

By using signal sources traceable to a standard, the calibration will be traceable to the same standard, provided the relevant documentation is maintained.

Manual and Automated Calibration Check

Both manual operation with computer assistance, and automated operation are possible. Automated operation requires programmable multiplexer and signal sources. See the list of supported devices below.

Assisted Adjustment of the Oscilloscope

A computer-aided adjustment procedure is also provided. By following instructions on the screen, the trained technician is guided through the adjustments required to correct the settings of the oscilloscope so that it is within the specifications.

Calibration Certificate

On request, LeCroy will perform calibration traceable to National Standard Organizations. Calibration certificates are provided as part of this service.

Functional Description

Calibration Practice

LeCroy oscilloscopes are auto-calibrating digital oscilloscopes and therefore do not require regular calibration like analog oscilloscopes. However, for users who require traceability to reference standards (such as those provided by the National Institutes of Standards and Technology), and for calibration laboratories which must inspect incoming instruments and perform recalibration at prescribed intervals, the LeCalsoft computer-aided test and calibration packages provide an easy solution.

Under guidance of the LeCalsoft program, some adjustments to the oscilloscope can be made by an electronics technician. However major deviations from specifications usually require repair by a trained service engineer. LeCroy regularly schedules training classes. If no in-house trained person is available, the nearest LeCroy service center can carry out repairs and calibration, and provide traceability to reference standards.

Using the LeCroy LeCalsoft Packages

For calibration checking, digital oscilloscopes have a great advantage over analog oscilloscopes because waveforms can be transferred to a host computer. This simplifies the calibration procedure enormously, makes it potentially faster and allows an extensive range of tests with unambiguous interpretation of the results.

LeCalsoft performs an extensive series of tests which verify the specifications of the oscilloscope. It includes many tests relevant to analog scopes such as Noise and Linearity tests. Although these tests are difficult and time consuming on an analog oscilloscope, they can be computer controlled and are quickly and easily performed on a digital oscilloscope. Tests which are specific to digital oscilloscopes, such as Sinefit tests are also included.

The various test options in LeCalsoft are presented to the operator in the form of a simple menu system. The user has the choice of performing an automated calibration check of the oscilloscope, or individually testing any of the specifications. Some of the tests require the use of high-quality external signal generators. The user receives instructions on

the screen when it is necessary to change the cable connections, but apart from this minor intervention, the tests are fully computer controlled when supported GPIB-programmable instruments are used.

Supported Instrumentation

LeCalsoft software works on any AT-compatible equipped with a math coprocessor and a National Instruments GPIB interface. Automated calibration checking is possible using a set of instruments from the following list. (For an automated calibration check, either the LeCroy or Keithley programmable multiplexer is required to feed the calibration signals to the oscilloscope input.)

RF sinewave generators:

Marconi 2019A, 2022C, 2030, 2031
Fluke 6060B, 6061A
Hewlett-Packard 8642A, 8642B
Rohde & Schwarz SMX

AF sinewave generators:

Marconi 2019A, 2022C, 2030, 2031
Hewlett-Packard 8642A, 8642B
Rohde & Schwarz SMX
Tektronix FG5010
LeCroy AFG 9100

DC Precision Power Supply:

Tektronix PS5004
Datron 4708 Autocal Multifunction Standard

Fast Pulse Generator:

Tektronix CG5001/CG551AP

Power Meters:

Hewlett-Packard HP436A, HP437B

Multiplexers:

Keithley 199 SYSTEM DMM/
SCANNER with LeCroy interface board.
LeCroy 4951, 4973-1, 4973-2
Multiplexers.

Frequency standard:

WWV or HBG1500

Recommended Accessories

A full kit of calibration connectors and interfaces is available from LeCroy. It includes all the necessary cables, adapters, splitters and filters, as well as the Programmable Multiplexer. Also available is a repair package including special tools, board extenders, etc., for computer-aided adjustment.

Use of Other Instruments

It is possible to perform the calibration check with some other unsupported signal sources. However, the user is then required to set up these instruments manually and to perform one measurement at a time. The LeCalsoft package

guides the user step by step, and controls the oscilloscope data acquisition and the computation of the results.

LeCalsoft compares the signal measured by the oscilloscope with the signal it would expect to receive from the generator. Warning messages are displayed

whenever tolerances are exceeded. Some of the adjustments may be carried out by the user when the test sequence is finished. In this case, the software will guide the user through the correct adjustment procedure. At the end of the calibration check, a printout can be generated to list the results.

Specifications

Computer Required: Any PC compatible with the IBM-AT standard, and equipped with a mathematical coprocessor and a National Instrument Inc. GPIB interface.

Operating System: DOS 3.0 upward

Medium: 3 $\frac{1}{2}$ " 1.44 Mb
5 $\frac{1}{4}$ " 1.2 Mb diskette

Major Tests Supported by LeCalsoft

Internal

To ensure proper calibration of the oscilloscope, internal auto-calibration tests are automatically executed during normal operation. This standard sequence of internal auto calibration tests is initiated by the software and the results are transferred to the PC for analysis.

The tests are:

- Calibration of the resolution of the time-to-digital converter with respect to the system clock
- Determination of the gain constants of the input amplifiers
- Offset compensation versus gain variation
- Global internal non-linearity
- General functionality check

Bandwidth

To calculate the bandwidth, the amplitudes of sine waves of increasing frequencies are measured. The sine wave generator is first set to 500 kHz with an amplitude 75% of full screen, i.e. ± 3 vertical divisions. The frequency is then swept up to the point where an amplitude drop of 3 dB is observed. This indicates the bandwidth.

This test is executed on all channels for 1 M Ω and 50 Ω input impedance and for all vertical sensitivities. It requires a sine wave generator with good flatness.

Generators supported under program

control are listed on page 2.

Linearity

15 different known voltages, varying from 5% to 95% of full screen, are applied by the external voltage reference source. For each voltage value, a full waveform is acquired, and the mean value is compared to the known input voltage. The linearity is determined through a linear regression fit to the 15 measurements. The slope, the offset and the chi-square of the fit are computed.

With the linearity test, many other related tests are performed: response time of the overload protection of the 50 Ω input, linearity of the variable gain calibration, range and linearity of the offset setting, and quality of the input coupling.

This procedure is executed on all channels for both 1 M Ω and 50 Ω input impedance. The test requires a DC source with a precision and time stability of 0.1%, a voltage range of 0 V to 20 V adjustable in steps of 5 mV, and an output current capability of 300 mA.

Power supplies supported under program control are listed on page 2.

Noise

The noise tests are executed on all channels for both 1 M Ω and 50 Ω input impedance, with AC and DC coupling, five different time-base settings, and open inputs. Full waveforms are acquired with different offset values. The peak-to-peak as well as the RMS values of each measurement are computed, and the maximum values are recorded. The program also indicates the occurrence of any "flyers", i.e. short noise peaks generated by the ADC's.

The noise tests also include:

- checking the linearity of the variable offsets of all channels between 2.5% and 97.5% of full screen.

- checking the stability of the ground line when switching the inputs between GROUND and DC coupling modes.

Rise time/Overshoot

Executed on all channels for both 1 M Ω and 50 Ω input impedance, these tests measure the rise time of the oscilloscope response to the input voltage step, as well as the amount of pre-shoot and overshoot. They require a voltage step generator with calibrated fast rise-time amplitude.

The Voltage Step Generator supported under program control is the Tektronix CG5001.

Sinefit

The performance of the analog-to-digital converter is evaluated in terms of the number of effective bits (a measure of the signal-to-noise ratio). It is measured on all channels, at a sensitivity of 50 mV/div., by applying a pure sine wave at varying frequencies and timebase settings

This test is a measurement of dynamic linearity. It shows the effect of such errors as noise, non-linearities and aperture jitter.

Timebase

The timebase test compares the internal clock with a very precise and stable external timebase reference (clock generator) such as the WWV standard or HBG 1500.

Trigger

The trigger capabilities are tested for all possible configurations. These include:

- Internal and external trigger sources
- DC, AC, HF-reject, and LF-reject couplings
- Trigger level settings in all slope modes.

SECTION 3	Block Diagram and Sub-Assemblies
------------------	---

3.1 9374, 9374M & 9374L Sub-Assemblies

F9302-1-4	Processor, 4 Mbyte RAM for 9374
F9302-1-8	Processor, 8 Mbyte RAM for 9374M
F9302-1-16	Processor, 16 Mbyte RAM for 9374L
F9350-21	Acquisition Memory, 2 X 50 K for 9374
F9350M-21	Acquisition Memory, 2 X 250 K for 9374M
F9350L-2	Acquisition Memory, 2 X 2 MB for 9374L
F9374-3 or -31	Main card, Quad 1 GHz, 500 MS/s, Front end, ADC, Time base
F9300-4	GPIB + RS232 interface
F9354-5	Quad channel front panel
PS9351	Power supply +/- 5V, +/- 15V.
PS9370	Auxiliary Power Supply +/- 5,8 V
93XX-Display	Video, deflection, CRT, yoke
M937X	Mechanical for 9374/M/L series

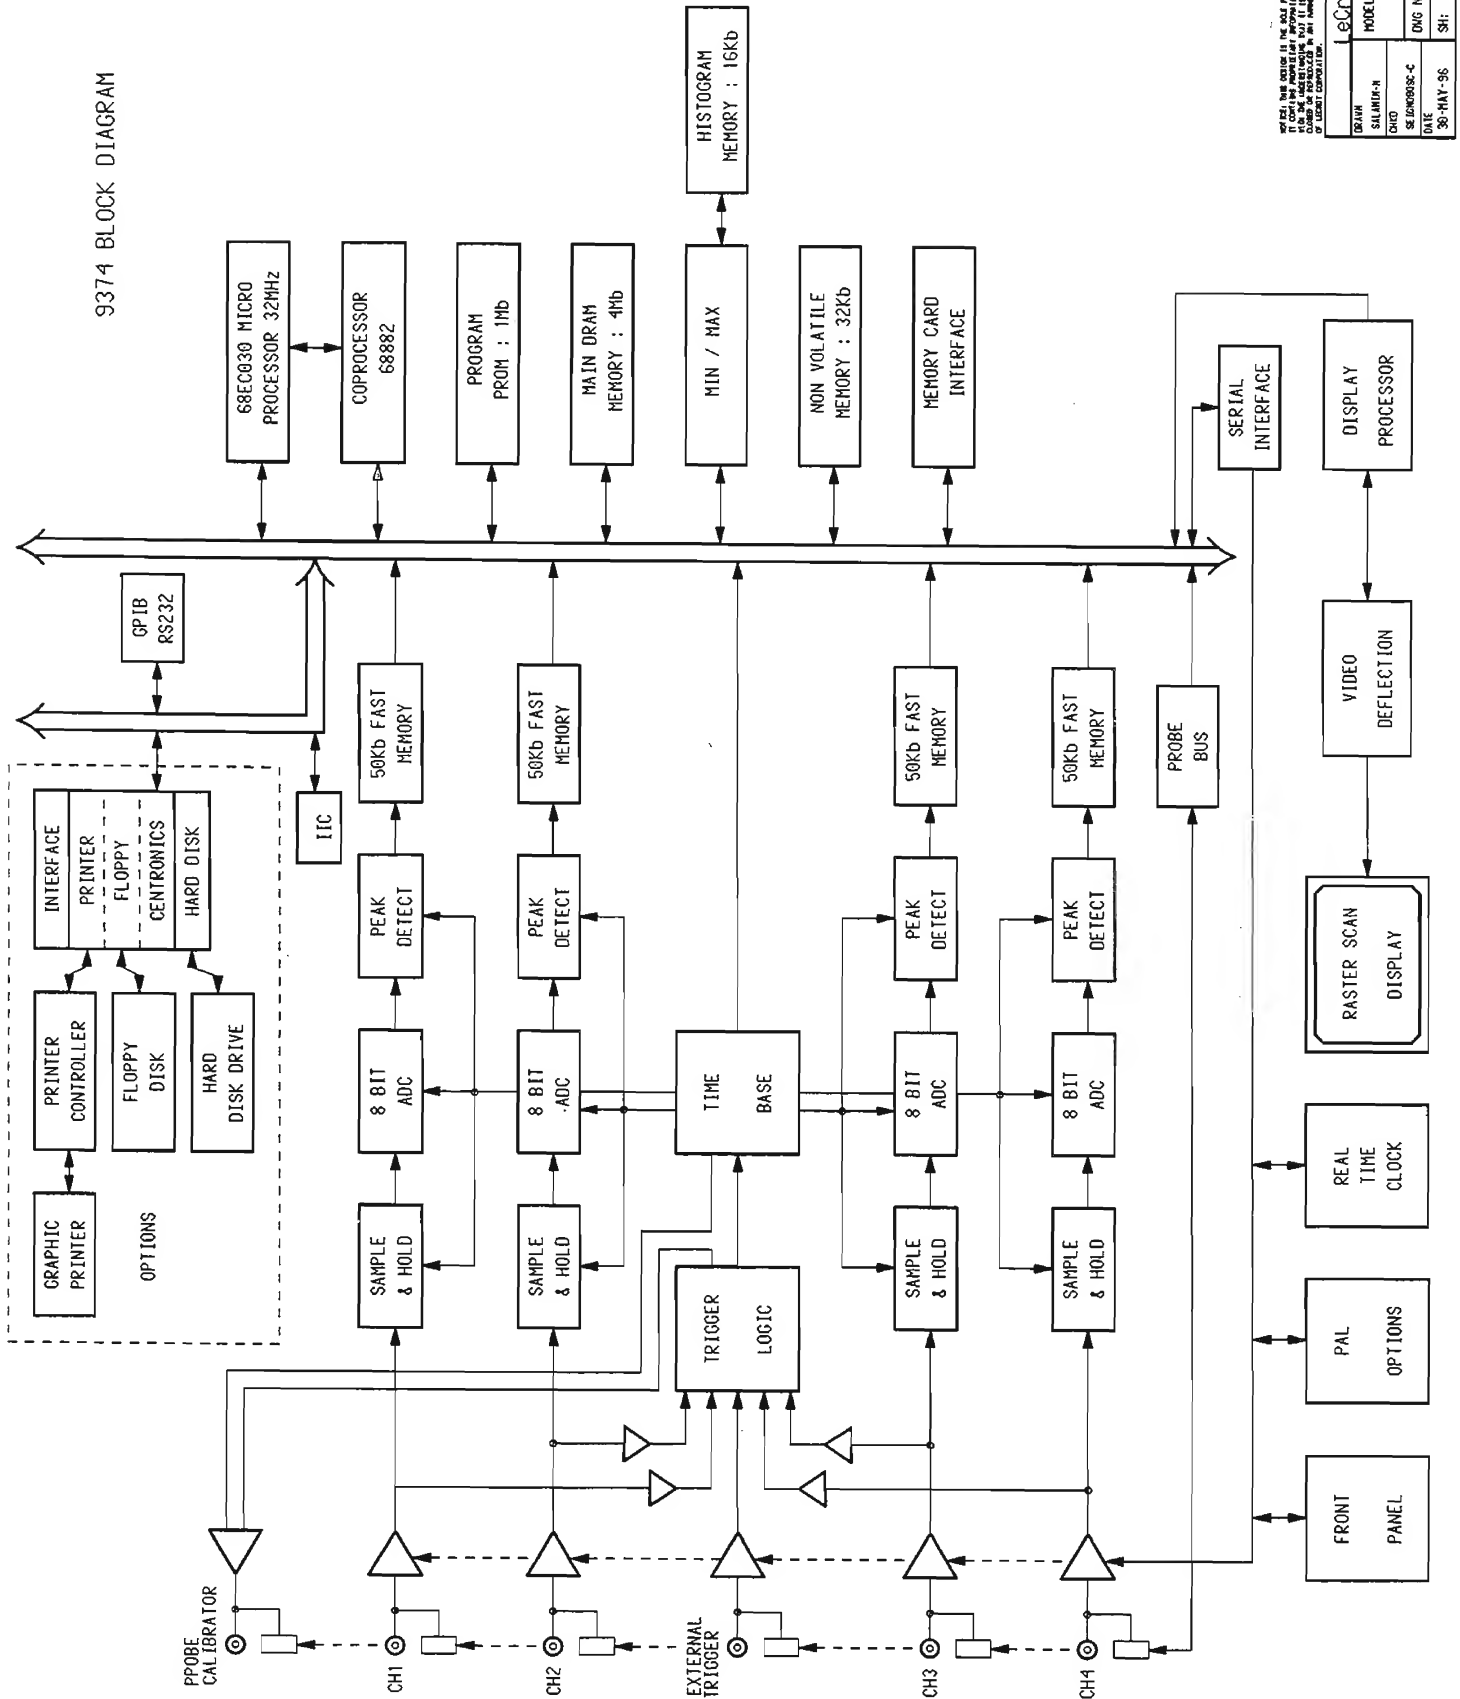

3.2 9374TM Sub-Assemblies

F9302-1-8	Processor, 8 Mbyte RAM for 9374TM
F9350TM-21	Acquisition Memory, 2 X 500 K for 9374TM
F9374-3 or -31	Main card, Quad 1 GHz, 500 MS/s, Front end, ADC, Time base
F9300-4	GPIB + RS232 interface
F9354-5	Quad channel front panel
PS9351	Power supply +/- 5V, +/- 15V.
PS9370	Auxiliary Power Supply +/- 5,8 V

SECTION 4 THEORY of OPERATION

4.1 Processor Board : F9302-1-4 for 9374, F9302-1-8 for 9374M & 9374TM, or F9302-1-16 for 9374L

This processor board is based on to the 68EC030 and 68882 coprocessor, with an internal clock frequency of 32 MHz, and 4 Mbytes or 8 Mbytes or 16 Mbytes memory. The internal Data Bus is 32 bits wide (DRAM, DSP), the peripheral Data Bus set 8 or 16 bits, and the Address Bus has 32 bits (A0-A30 and A31 for the Min/Max.).

4.1.1 Processor Block Diagram

4.1.2 Parallel Peripherals

DRAM memory : Data bus 32 bits

The DRAM memory of 4 Mbytes or 8 Mbytes or 16 Mbytes (up to 64 Mbytes) is used as the program memory and working memory.

The compacted program of 1MByte stored within the Flash EPROM, IC of 8 Mbit is de-compacted, loaded and executed in the DRAM.

DSP interface : Data bus 32 bits.

An optional Digital Signal Processor is connected to the processor board via a 32 bits address bus.

F9374-31 main board interface : Data bus 16 bits.

The main board is connected to the processor via a 32 bits address bus.
See section 4.3.

Min/Max calculation : Data bus 16 bits.

A gate array MNX401 makes a histogram in its associated 16 Kbytes memory and remembers the minimum and maximum data values it sees.

Flash memory : Data bus 8 bits.

Segmented Flash EPROM of 1 Mbyte (IC of 8 Mbits) contains 16 Kbytes program, executable at power on, and other compacted programs executable in the DRAM.

Memory card : Data bus 8 bits.

An interface is implemented to support an external memory card, PCMCIA / JEIDA 4, type 68 pins, whose size can range from 16 Kbytes to 64 Mbytes, with the extension to support flash memory and I/O cards.

Graphic processor : Data bus 8 bits.

The graphic processor of the raster scan display is a gate array designated MDS410.

Clock frequency	: 48 MHz.
Trace and characters memory	: 32 Kbytes (SRAM).
Bitmap memory	: 128 Kbytes (BMRAM).
Character font	: 32 Kbytes (SRAM).

Non volatile memory : Data bus 8 bits.

A static RAM of 32 Kbytes (IC of 256 Kbits) contains the parameters used at power on to initialize the scope and the stored panels parameters. This memory is battery backed up

DAC command of the display intensity : Data bus 8 bits.

The control of the display intensity is done by a RAMDAC, up to 8 traces.

Status and command registers : Data bus 8 bits.

Status (read) and command (write) registers of 12 bits address, control the memory card and front panel interface during the boot process or after a RESET.

4.1.3 Serial Peripherals

The processor controls the digital and analog section with a dual serial controller.

DAC's registers (read/write)
 Front panel registers (68HC05C4)
 RTC registers (68HC68T1)
 Probe detection
 Software options (GAL)
 Front end control
 Trigger control (MTR408)

Real time clock

Integrated circuit 68HC68T1 (Motorola or RCA).
 Resolution : 1 sec to 99 years.
 Clock frequency : 32.768 KHz.
 Non volatile memory : 32 Kbytes.
 Data & Address bus : 8 bits.
 Interrupt level : 5.

4.1.4 External Interfaces

Serial RS232 interface and Parallel GPIB interface.
 See F9300-4 description, section 4.4.

4.1.5 Optional Interfaces

Graphic Printer : F9300-6 interface and F9300-7 printer controller.
 Internal graphic printer
 Floppy Disk Drive : F9300-6 interface
 1.44 Mbytes floppy
 Centronics Printer : F9300-6 interface
 Hard Disk Drive : F9300-8 PCMCIA III controller,
 130 Mbytes hard disk

4.2 F9374-3 or -31 Main Board

4.2.1 Introduction

The board is divided into five sections :

- Front-end
- Microprocessor control.
- Trigger
- Analog to Digital Converter
- Time base

4.2.2 Front End

The front-end system provides the signal conditioning for the ADC system. Except at 1GS/s and 2GS/s, all channel are identical, thus only one channel will be described here.

The main functions of the FE without the amplifier (HFE419) are:

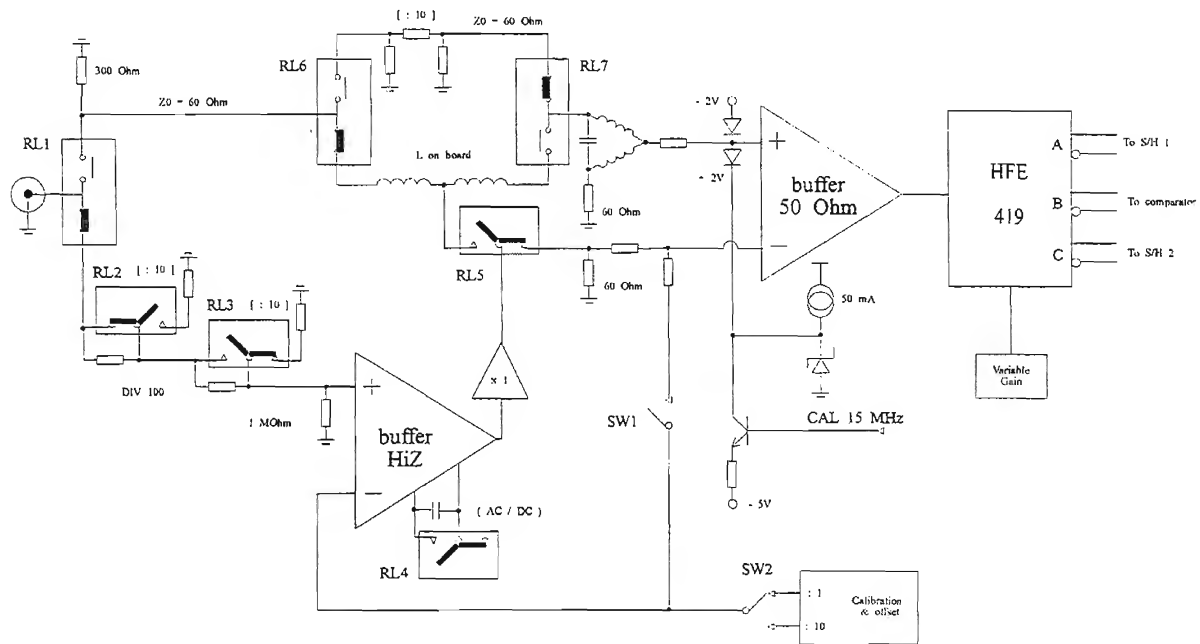

- Four channels operation, calibration with Software control
- Input protection (clamp + thermal detection) and coupling (AC, DC, 1 M Ω , 50 Ω).
- Attenuator by 10 in the 50 Ω path and attenuators by 10 & by 100 in 1M Ω path.
- Offset control of ± 1 V and CAL control of ± 1.4 V.

The main functions of HFE419 are:

- Amplitude normalisation for the ADC system : at the BNC the dynamic range is 16 mV to 8V FS at 50 Ω and to 80V FS (full scale) at 1 MOhm in a 1-2-5 step sequence and the ADC system input is 500 mV differential.
- Fine gain control to fill in the fixed vertical sensitivities.
- Bandwidth limit filter at 30 MHz and 100 MHz.
- Triggering with standard coupling and TV trigger on four channels and External.

4.2.2.1 Block Diagram

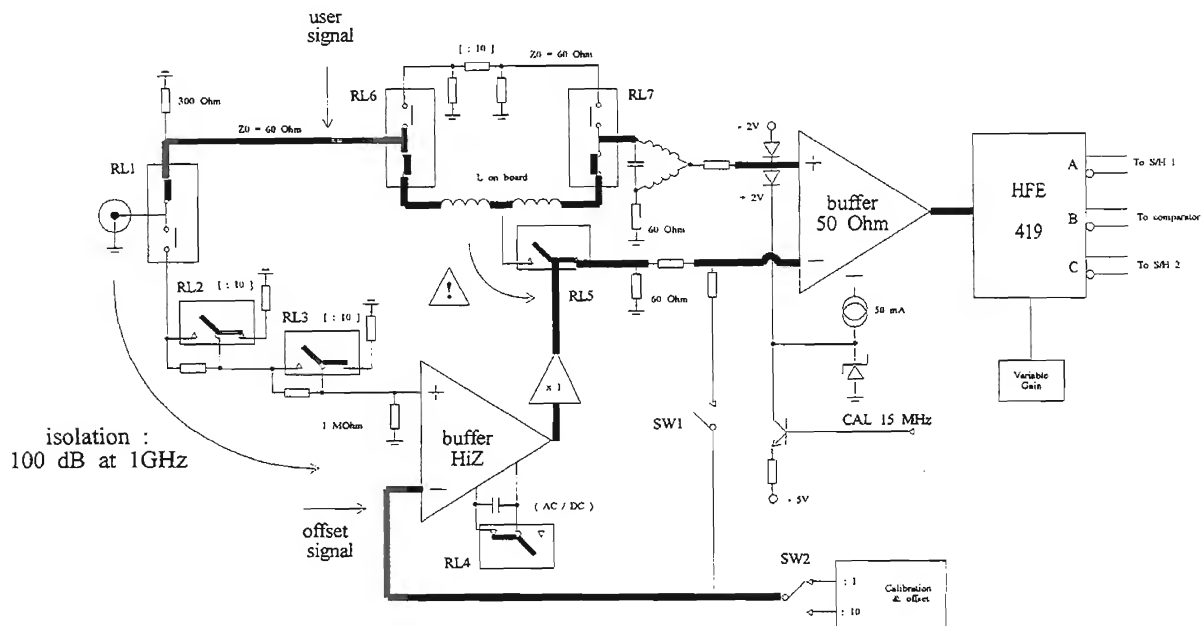

4.2.2.1.a Power off State : 1 M Ω input

- Relay RL1 ($_50\Omega$) selects the input between the HiZ (1 M Ω) and the 50 Ω path. A diode circuit senses the temperature of the 300 Ω termination resistor (in parallel with 60 Ω to have $Z_{in} = 50\Omega$) and sets the $_OVL$ bit low if overheating is detected.
- The 50 Ω path is then disconnected by the hardware and the signal will be in the 1 Mohm input.
- Relay RL2 ($_10HZA$) selects the input between divide-by-10 or direct for the signal in the **HiZ** path.
- Relay RL3 ($_10HZB$) selects the input between divide-by-100 or divide-by-10 for the signal in the **HiZ** path.
- Relay RL4 ($_DC$) sets the AC/DC coupling in HiZ.
- Relay RL5 ($_HZ$) enables the **HiZ output** (selection between 1M Ω output & offset for 50 Ω buffer).
- Relay RL6($_10HFA$) selects the input between divide-by-10 or direct for the signal in the **50 Ω** path.
- Relay RL7 ($_10HFB$) selects the output between
 - :1 in 50 Ω or HiZ (if RL5 ON)
 - :10 in 50 Ω .

- Switch SW2 ($_1$:1OFF)) sets div1 or div10 for the DC offset.
- CAL signal is equivalent to Offset signal.
- There is no AC/DC coupling in the 50Ω path.
- CAL 15MHz is the calibration clock signal use for 1GS/s.

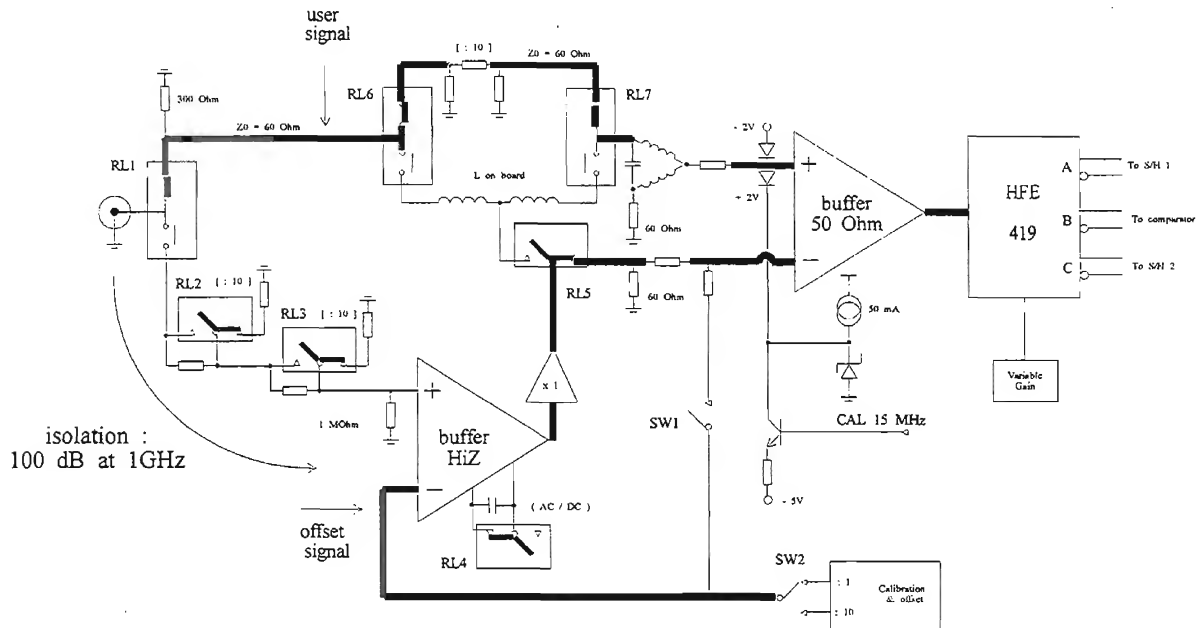

4.2.2.1.b 50Ω input : Direct Path

- The first relay RL1 is in a 50Ω characteristic impedance line. The second and third relay (RL6 & RL7) are in a 60Ω line.
- “L on board” is there to compensate for the capacitance of RL5 ($Z_0 = 60\Omega$).
- The 50Ω buffer source impedance is equal to:

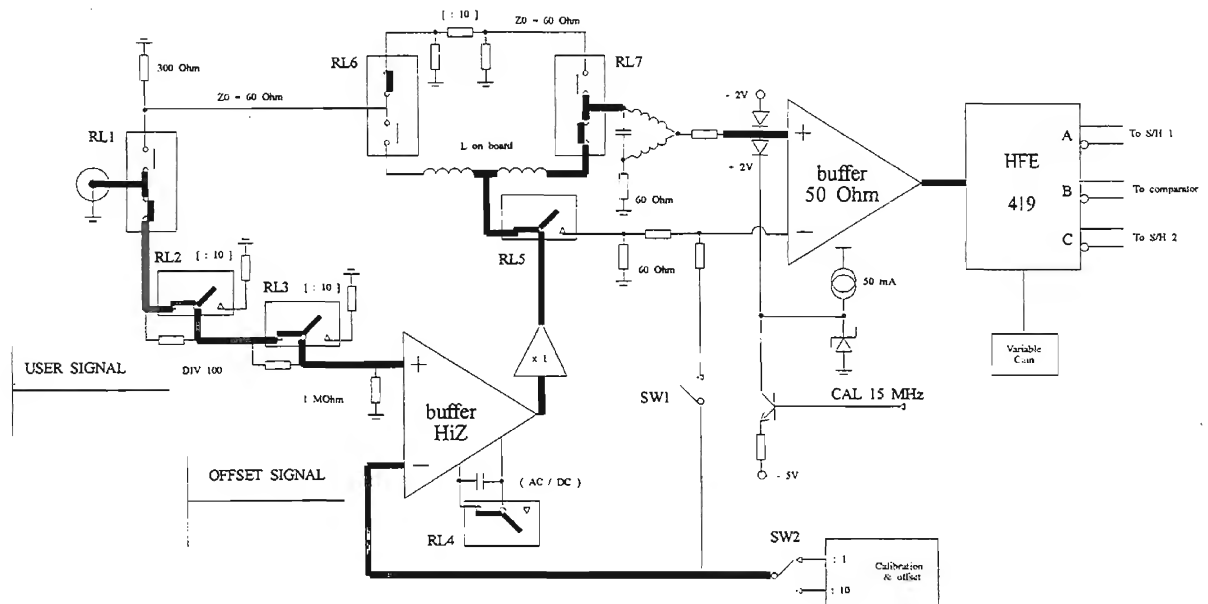

$$R_s = (\text{clamp resistor}, 24\Omega) + (50\Omega // 300\Omega // 60\Omega) \cong 49\Omega$$
- Isolation with : RL5 & filter (between RL5 and the 50Ω buffer).
 The HF signal is filtered and view by the DC amplifier (CA3100) in the 50Ω buffer.

4.2.2.1.c 50Ω input : Divide-by-10 Path

- The divide-by-10 attenuator is a not symmetrical Π attenuator:
- The input signal is ten times greater, less 20dB of isolation compensate with RL5.

4.2.2.1.d 1MΩ input : Direct Path

- Buffer HiZ is the AC coupled FET transistor controls in DC with a precision OP amp.
- x1 buffer is a powerful integrated buffer (gain $\cong 1$)

4.2.2.2 Front End Analog controls

- One precision DAC with an associate circular memory (μ P system) drives and refreshes a multiple sample-and-hold system. The DC calibration control is common to all four channels. Each channel has two analog controls.

The addresses are :

0300 0000 write channel 1 gain control
 0300 000c write channel 4gain control
 0300 000e write channel 4 offset & CAL control
 0300 0002 write channel 1 offset & CAL control
 0300 0004 write channel 2 gain control
 0300 0006 write channel 2 offset & CAL control
 0300 0008 write channel 3 gain control
 0300 000a write channel 3 offset & CAL control

4.2.2.3 Front End Digital controls

0141 0z00 - 0141 0zff write channel 1 control register
 0141 1z00 - 0141 1zff write channel 2 control register
 0141 2z00 - 0141 2zff write channel 3 control register
 0141 3z00 - 0141 3zff write channel 4 control register

Front-end control with gain range

The name of the control bit describes the state of the relay when the bit is high.

Two serial registers give some information about the front-end state.

0140 4z00 - 0140 4zff read channels overload

7							0
_INTWD	_INTIIC	_OVL_T	_PPOFF	_OVL_D	_OVL_C	_OVL_B	_OVL_A

where :

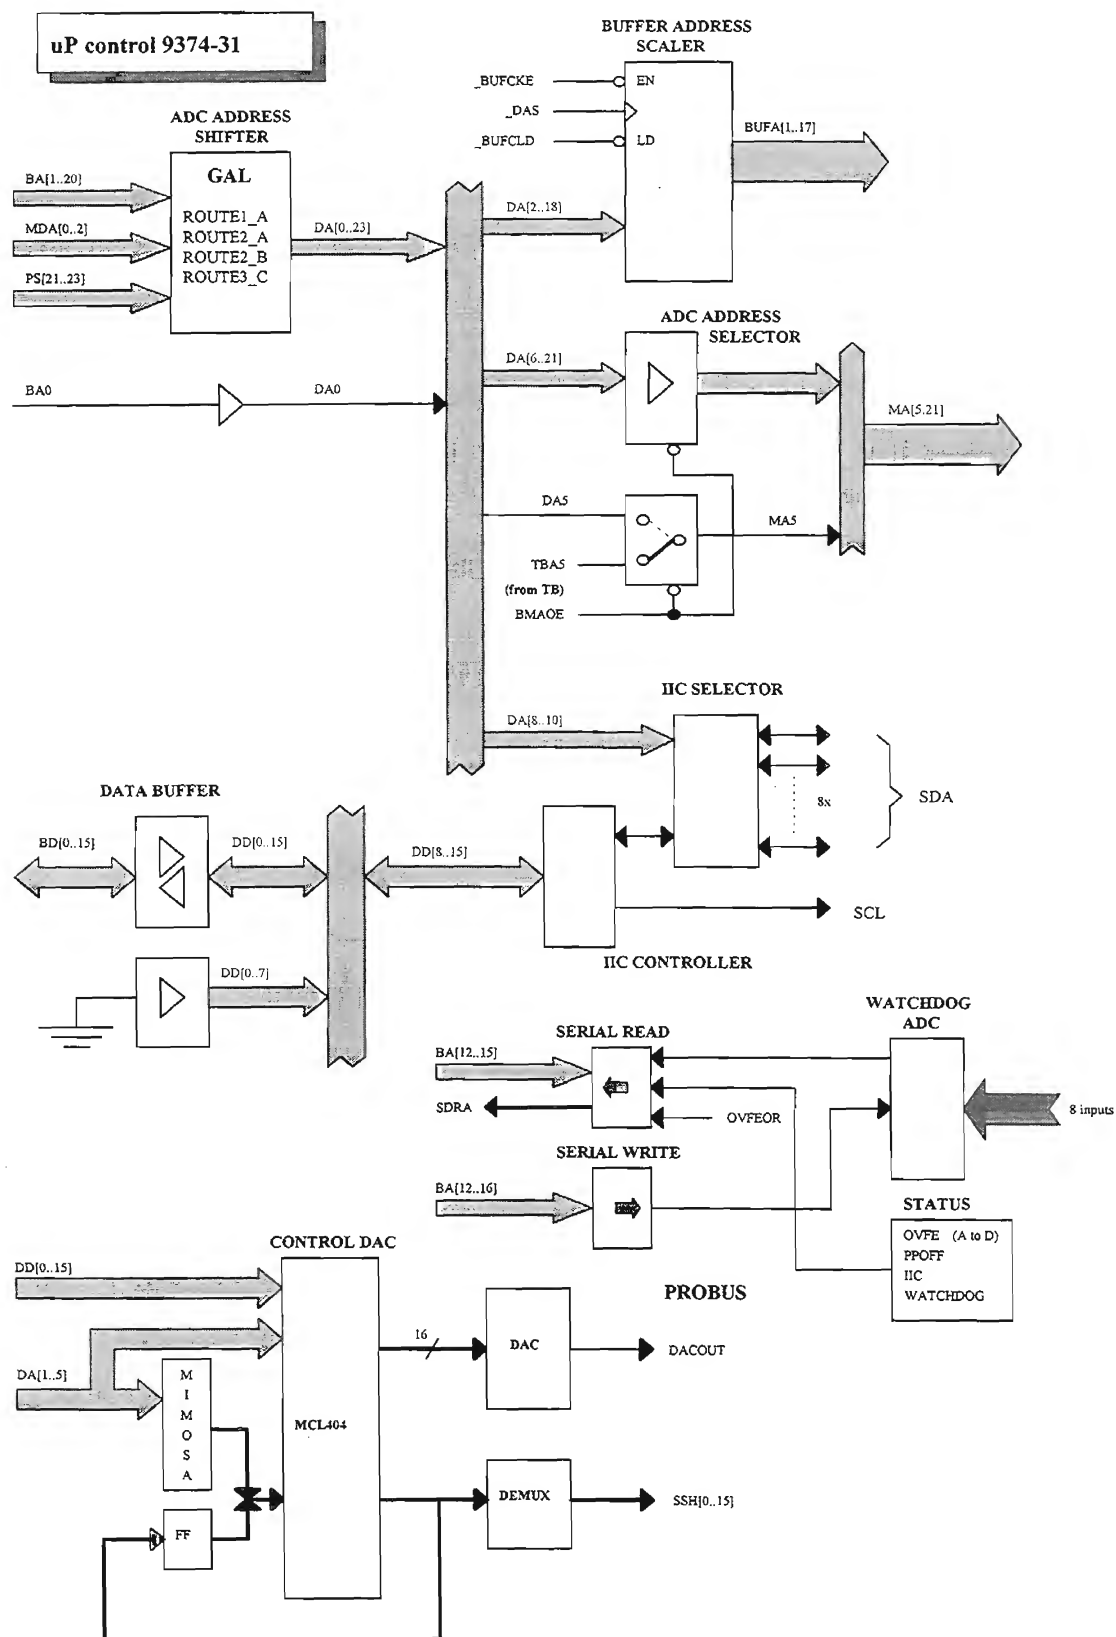

- _INTWD watchdog ADC interrupt,
- _INTIIC I²C protocol interrupt,
- _PPOFF probe power overload interrupt,
- _OVL_n overload indicator (ch 1, 2, 3, 4, EXT).

A low state indicate that overload or interrupt is detected.

0140 5z00 - 0140 5zff read overload sum

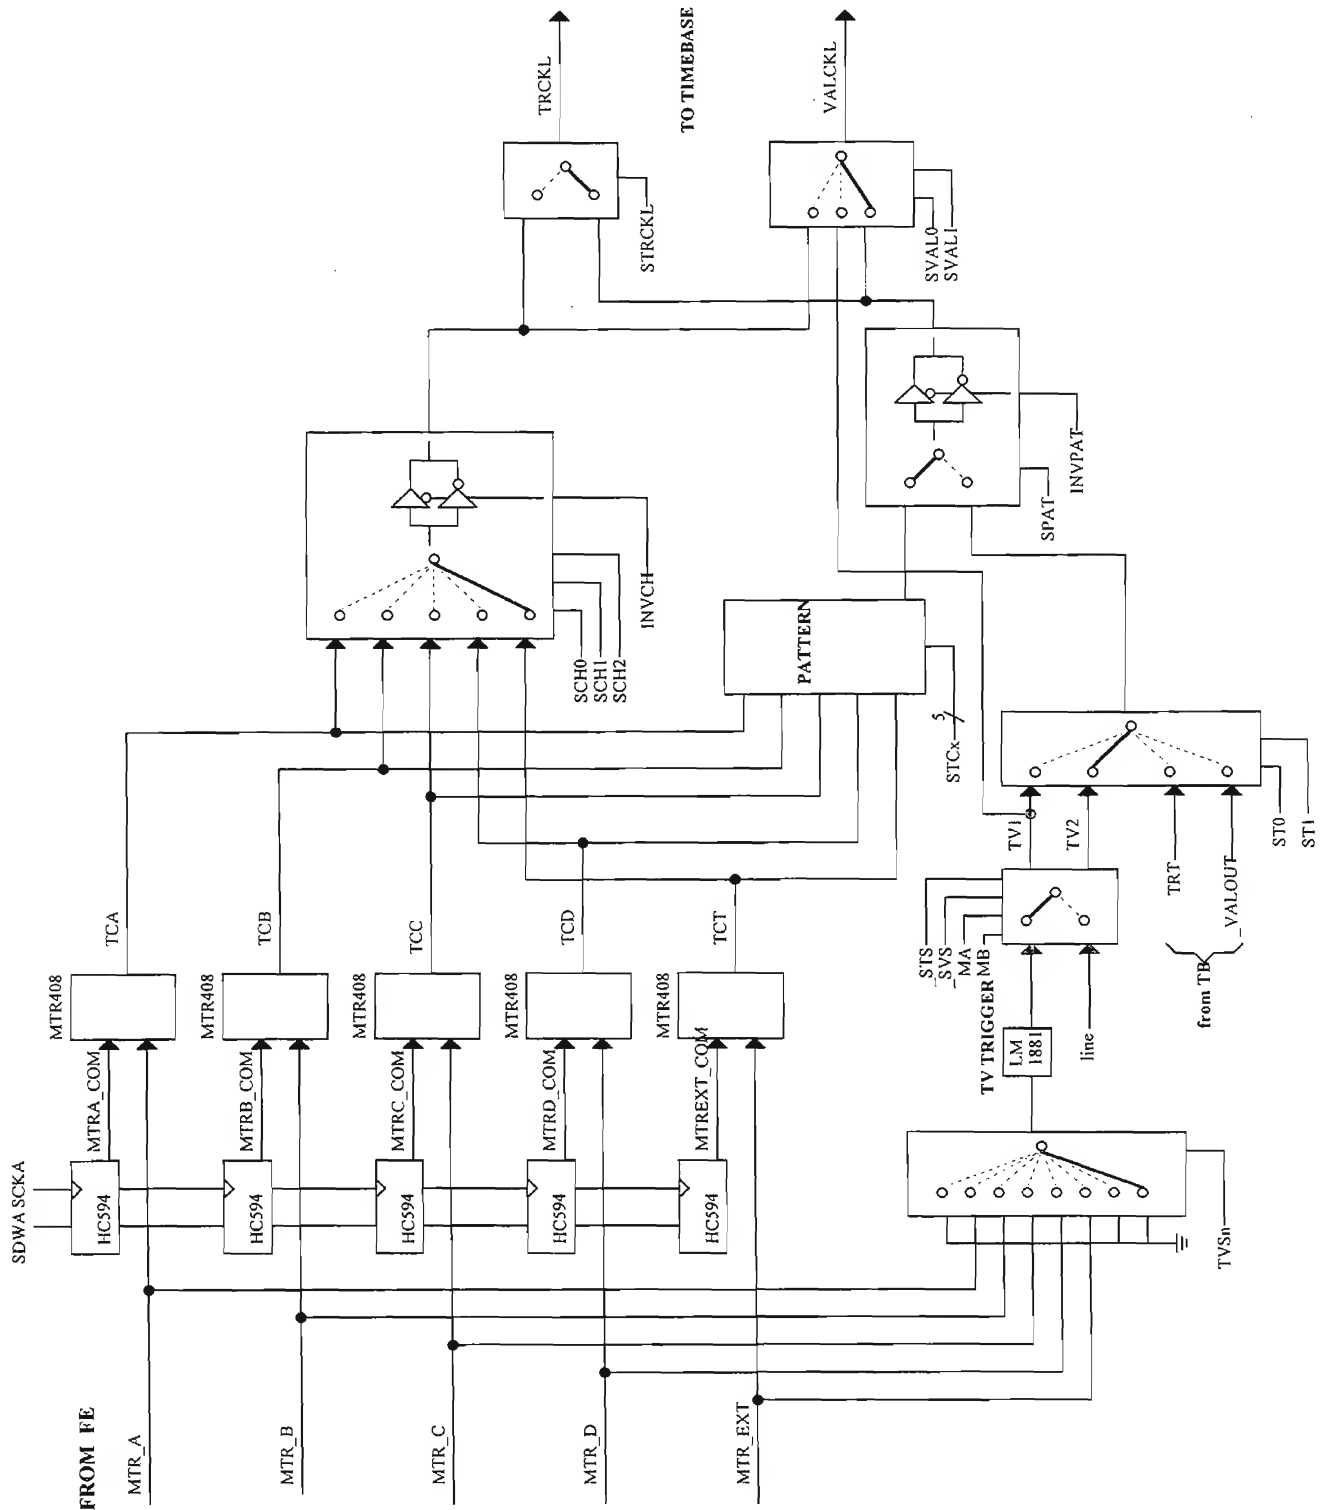

- OVLSUM bit 7, Sum of the eight above bits.
 0 = OK,
 1 = problem occurred (read channels overload)

4.2.3 Microprocessor Control

4.2.4 Trigger

4.2.4.1 Block Diagram

The different trigger couplings are :

- DC
- AC : cut off frequency is almost 10 Hz.
- LF REJ : set a single pole high pass filter with a cut off frequency at 50 kHz.
- HF REJ : set a single pole low pass filter with a cut off frequency at 50 kHz.
- TBWL : single pole low pass filter at 30 MHz.

The amplitude at the input of the MTR408 is 320 mV FS .

4.2.4.2 Digital Controls

The 40 bit shift register, is allocated as follows :

0141 4z00 - 0141 4zff write trigger control register

39	---	TBWL_A	HFR_A	AC_A	DC_A	---	SNEG_A	SPOS_A	32
31	TEXT50	TBWL_B	HFR_B	AC_B	DC_B	---	SNEG_B	SPOS_B	24
23	---	TBWL_C	HFR_C	AC_C	DC_C	---	SNEG_C	SPOS_C	16

7	---	TBWL_EXT	HFR_EXT	AC_EXT	DC_EXT	---	SNEG_EXT	SPOS_EXT	0
	_EXT/10	TBWL_EXT	HFR_EXT	AC_EXT	DC_EXT	---	SNEG_EXT	SPOS_EXT	

TEXT50 0 = 1 M Ω external input coupling, 1 = 50 Ω external input coupling.
_EXT/10 0 = attenuation is ON, 1 = OFF.

4.2.4.3 Analog Controls

A sample and hold fed by the precision DAC provides the threshold level.

The addresses are :

0300 0010 write EXT threshold control
0300 0018 write channel 1 threshold control
0300 001a write channel 2 threshold control
0300 001c write channel 3 threshold control
0300 001e write channel 4 threshold control

4.2.4.4 TV Trigger

Each channel has a pick-off after the HFE419 or after the high impedance buffer for external trigger. The TV trigger source is selected via bit TVS and drives a times 10 amplifier with complementary outputs. These outputs are selected (_TVINV) depending on the state of the selected HFE419 gain.

The TV trigger uses a commercial chip (LM1881) and provides two outputs,TV1 & TV2. This circuit is able to trigger on different TV line number standards.

▪ Digital Controls

The 16 bit shift register, written using the serial protocol, is allocated as follows :

0141 5z00 - 0141 5zff write trigger TV and MST412 oscillator control register

15							8
_TVINV	TVS2	TVS1	TVS0	HDTV	875	MB	MA
7							0
_STI	_STW	_SVS	_STS	--	--	--	--

_TVINV 0 = inverting TV trigger (to compensate for inversion in MFE409).

_SVS 0 = enable TV1 source.

_STS 0 = enable TV2 source.

_STI 0 = enable interval width mode for MST412 oscillator control.

_STW 0 = enable pulse width mode for MST412 oscillator control.

TVS2	TVS1	TVS0	TV trigger source	HDT V	875	line setting
0	0	1	channel A	0	0	525-625 TVLO
0	1	0	channel B	0	1	875 (MED)
0	1	1	channel C	1	0	1225 (HIGH)
1	0	0	channel D	1	1	2500 (HDTV)
1	0	1	external trigger			

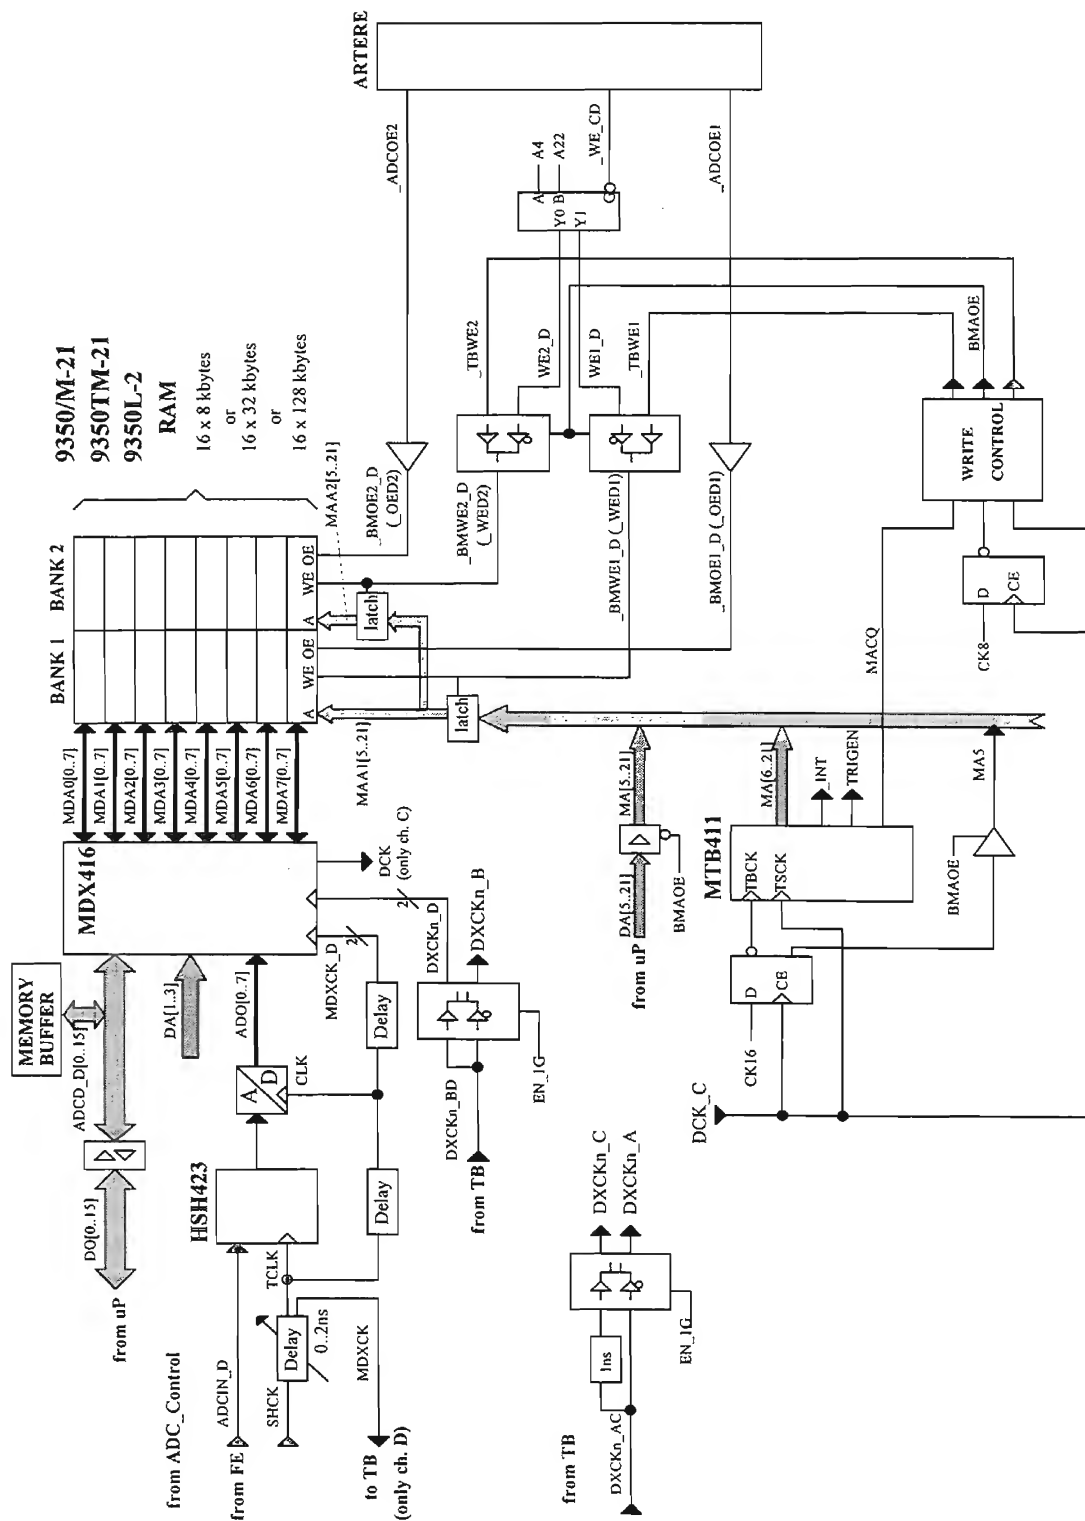

4.2.5 Analog to Digital Converter

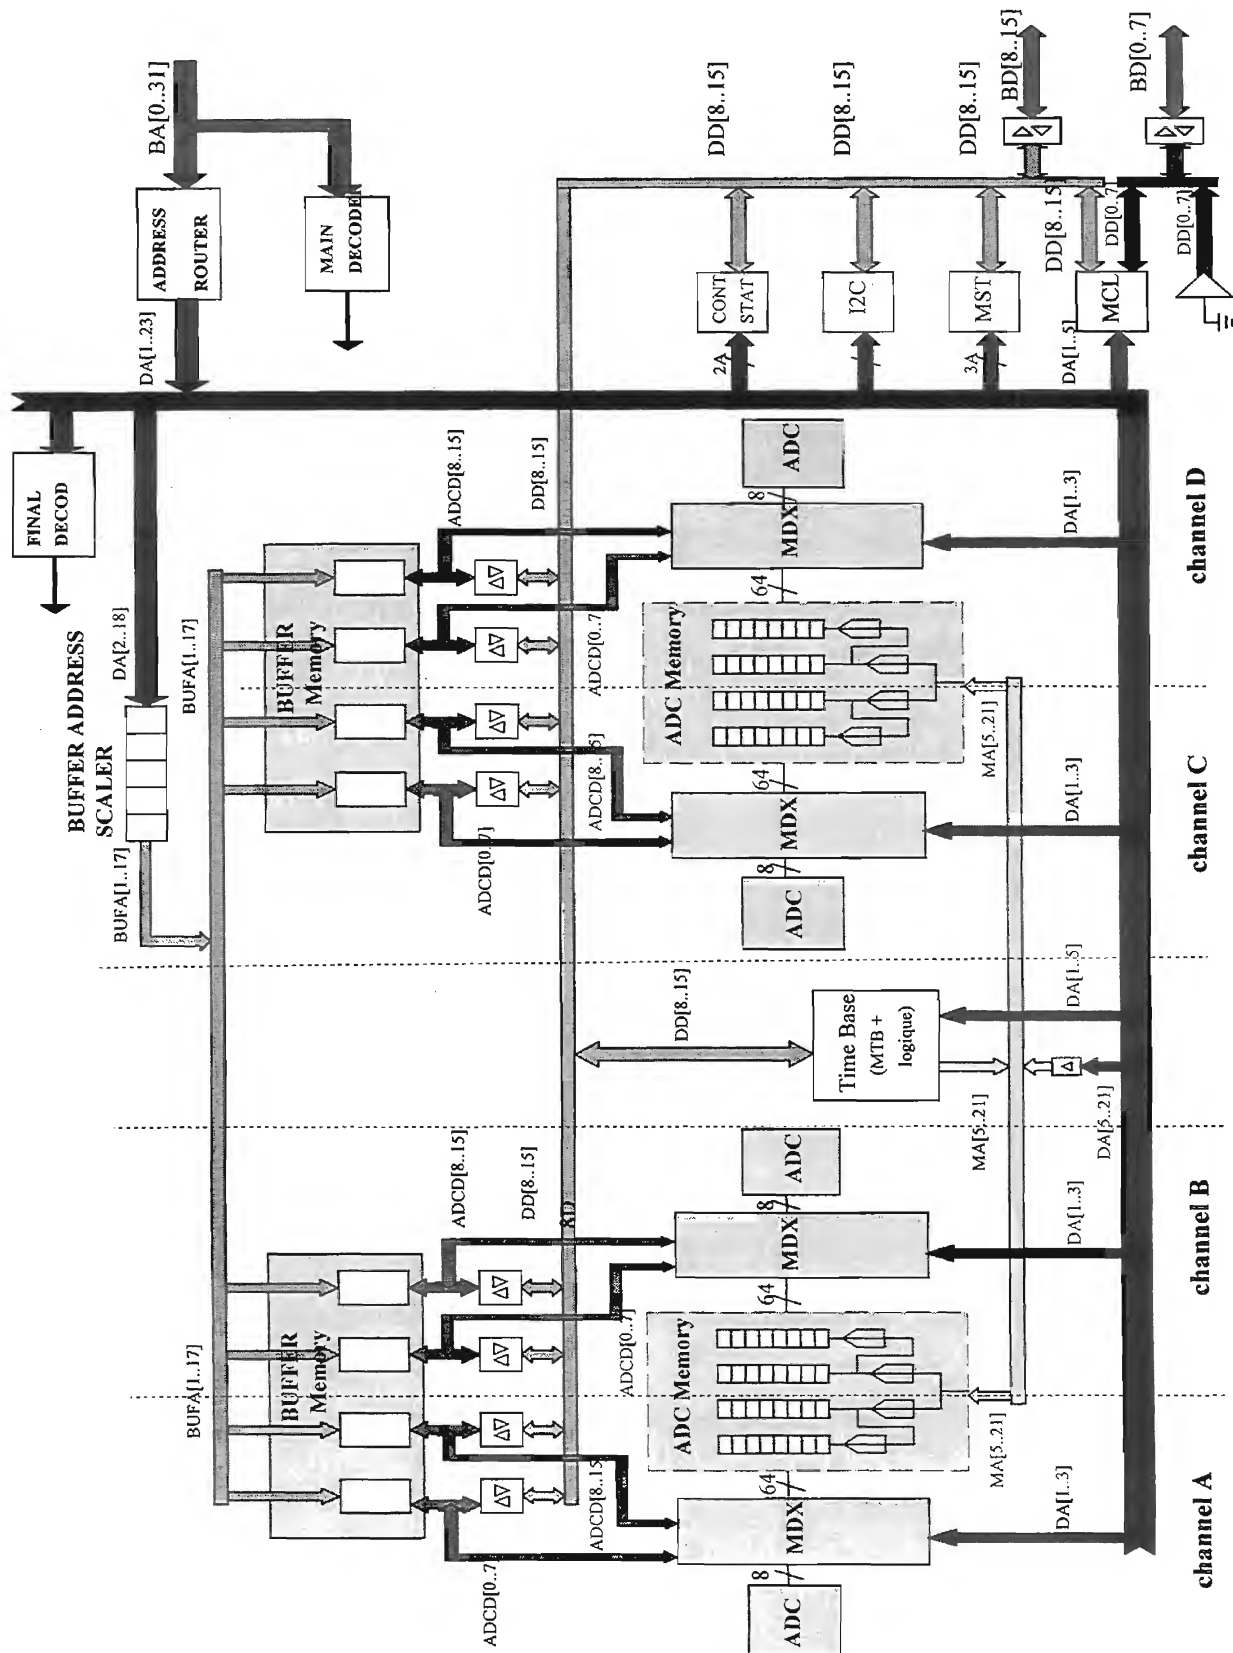

4.2.5.1 Introduction

The analog to digital converter system does the signal conversion to 8 bits.

- Sample and Hold : the HSH423 Hybrid with Analog bandwidth of 1GHz, performs the track and hold before the ADC. It is clocked at three different frequencies : 500 MHz, 400 MHz, and 200 MHz. The offset is calibrated by use of a current mirror controlled by a 8 bit DAC.
- Flash ADC : the TDA8718 is a folding ADC working at a maximum clock speed of 500 Ms/s. The gain is calibrated by adjusting the internal resistor ladder using a 8 bit DAC. The ADC input level is 240 mV peak to peak on 75 Ω , from the nominal 320 mV front-end output.
- Demultiplexer : the MDX416 monolithic is used to demultiplex the ADC output, and catch the glitch (min/max).
- Buffer Memory : 128K bytes
- ADC Memory : 50K points for 9374, 250K for 9374M, 500 K for 9374TM, 2M points for 9374L. Memory length may be extended by combining the acquisition memories of multiple channels.

4.2.5.2 ADC Block Diagram

4.2.6 Time Base

4.2.6.1 Introduction

The main clock (SHCK) comes from a PLL oscillator with a 10 MHz reference, there is a control bit (SEXTREF) to select an optional external reference with ECL level.

The PLL output frequency is controlled by three bits (SF500, SF400 and _SF200). The main clock is directly used by the sample-and-hold, the analog-to-digital converter and the time-to-digital converter for real time measurement. It is also used for synchronization inside the MDX416 demultiplexer.

The main clock is then feedback to the time base, from the ADC system (MDXCK), to drive a pre-divider controlled by four bits (DIVn). The output of the pre-divider then drives the MTB411 frequency divider (FD). At fastest speed, when the MTB411 frequency divider is not used, the clock to FD (FDCK) can be disabled (DISFD).

The main clock can also be driven from the external trigger BNC, this path is selected by a control bit (SEXTCK). The external clock threshold can be modified by two bits from the time base mode control (EXTCTH1 and EXTCTH2). This external clock frequency range is 0 to 100 MHz.

The PLL oscillator has in fact only two values, 500 and 400 MHz, the 200 MHz is a secondary path coming from a divider by two.

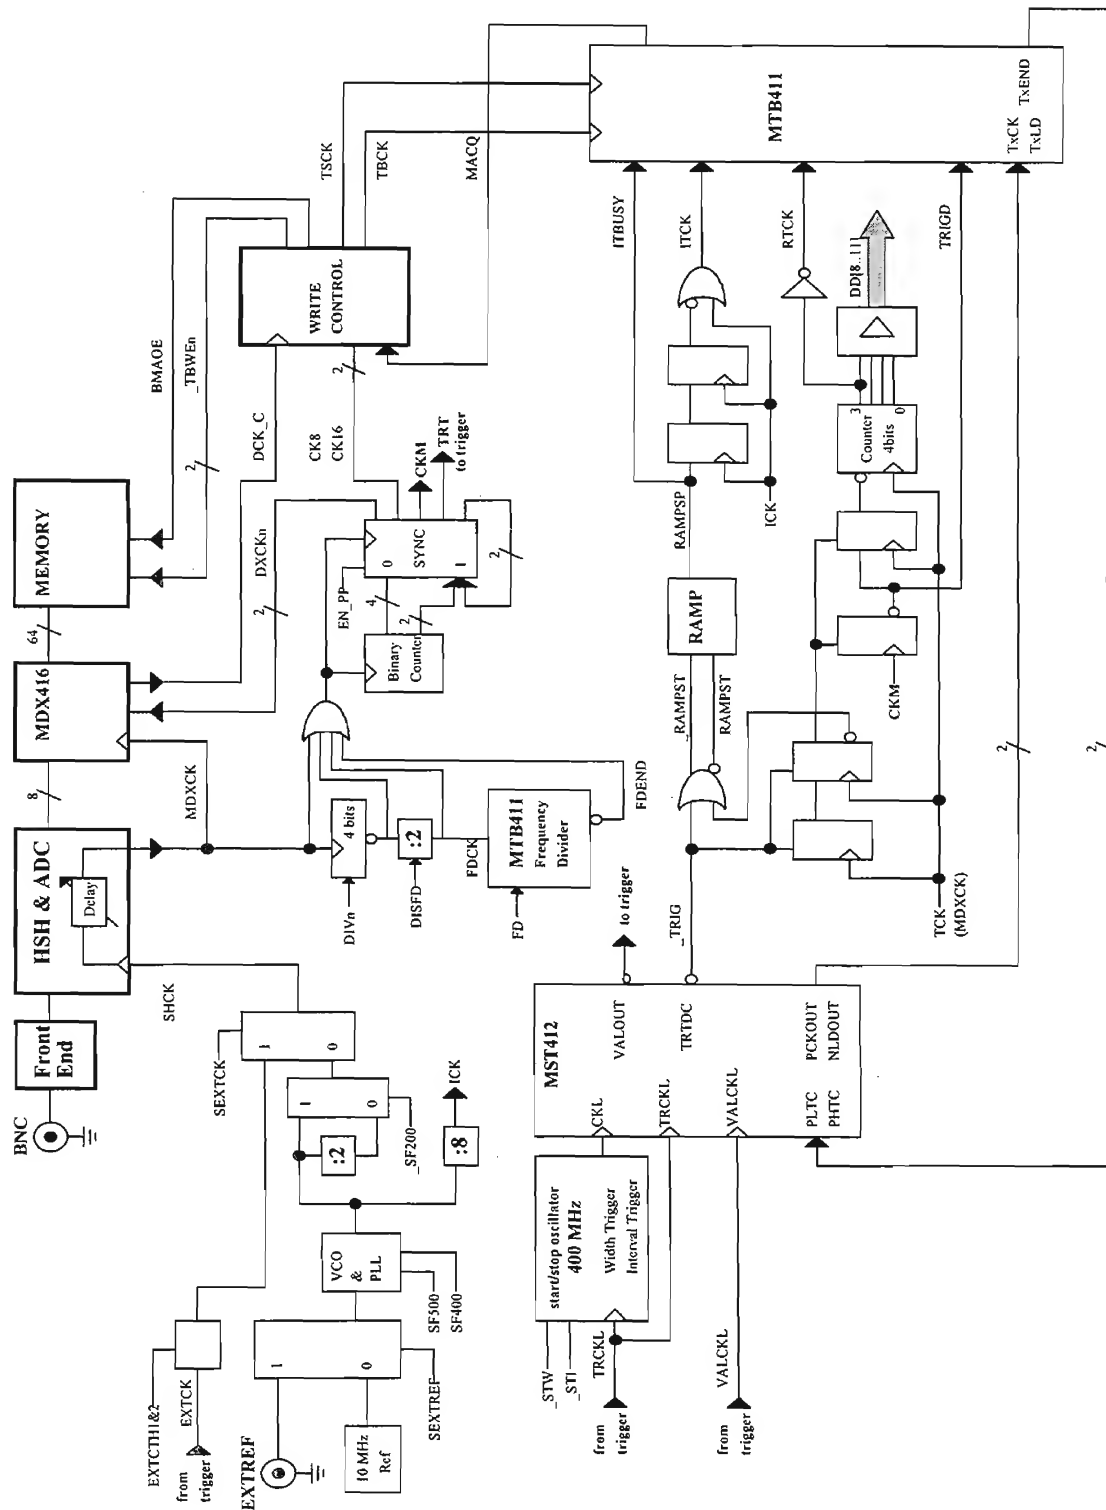

- 500 MHz is used for fast timebase settings, 1 GS/s, 2 GS/s and RIS mode.
- 400 MHz is used as soon as possible when starting to skip samples (skip > 1) in order to be able to do a peak detection (min-max) with the MDX416.
- 200 MHz is used for Roll mode.

There is also another reference clock for the interpolated TDC (ICK) which comes from a divider by eight. Its frequency is then 62.5 or 50 MHz, to be able to directly use the MTB411 counter (general time base control, start/stop, counters, memory address).

The output of the fast frequency divider is combined with the output of the MTB411's FD to drive a synchronous clock generator. The main functions are :

- reference to the MDX416 (DXCKn) and to the memory address generator (CK8 and CK16),
- synchronize the trigger (CKM for TRIGD),
- calibrate the MST412 use for smart trigger (TRT).

4.2.6.2 Time Base Block Diagram

4.2.6.3 Digital Control

0141 8z00 - 0141 8zffwrite Time Base divider register

15					8		
---	---	---	---	---	SECK500	EN_1G	SEXTREF
7					0		
DISFD	_SF200	SF500	SF400	DIV3	DIV2	DIV1	DIV0

where :

- SECK500 select optional external clock (100 MHz to 500 MHz).
- EN_1G enable 1 GS/s acquisition (1 ns delay on MDX416 clock).
- SEXTREF select optional external PLL clock reference (10 MHz \pm 5 %).
- DISFD disable FD clock to MTB411.
- _SF200 select oscillator frequency 200 MHz.
- SF500 select oscillator frequency 500 MHz.
- SF400 select oscillator frequency 400 MHz.
- DIVn frequency pre-divider (4 bits).

4.2.6.4 Trigger Selection

Each differential outputs of the five MTR408 from the Front-End (TCx) are selected (bit SCHn) and then inverted (bit INVCH) to drive the TRCKL signal and the VALCKL signal (bit SVAL1).

A logical function of the TCx signals can be selected (bit STCx) for the pattern generator. A few single ended signals can also be selected one at a time (bit STn). These signals are TV1 and TV2 for television trigger, TRT for test and calibration of MST412, _VALOUT for drop-out trigger.

Then there is a selection between the pattern and the single ended sources (bit SPAT). The signal obtained is inverted (bit INVPAT) and used to drive TRCKL (bit STRCKL). There is also a choice between this signal and TV1 to drive VALCKL (bit SVAL0). The pattern trigger logic function is any "AND" combination of TCx input signals, inverted or not. All the control are done through a 16 bit serial register.

4.2.6.5 Smart Trigger

The VALCKL source drives the MST412. The TRCKL source goes through a buffer to drive the MST412 and control the smart trigger 400 MHz start/stop oscillator.

The MST412 oscillator is usually free running, but when using glitch trigger mode the oscillator is enable only during the pulse duration (bit _STW), and when using interval width trigger mode the oscillator is restarted at each edge (bit _STI). There is also a time base mode control register with roll mode interrupt enable (RMIE), external clock control (SEXTCK, EXTCTH1 and EXTCTH2), buzzer (BUZZ) and calibration front panel output signal selection (PCSn).

4.3 F9300-4 GPIB and RS 232 Interface

This board is connected to the processor through a flat cable.
Data bus is 8 bits, address bus: 12 bits.
Address 0180 000 to 0180 00FF.

4.3.1 RS 232 Serial Interface

Based on the 2661A IC from Signetics or Philips.

- Clock frequency 4.9152 MHz.
- 4 internal registers of 8 bits.
- Interrupt level 2.
- Connector type DB9 with 9 male pins.

4.3.2 GPIB Interface

Based on the circuit 7210 IC from NEC.

- Clock frequency 5 MHz.
- 8 internal registers of 8 bits.
- Tri-state external GPIB drivers. - Low level output.
- Interrupt level 3.

The GPIB address is set by software and stored in non-volatile memory.

4.4 F9354-5 Front Panel

The front panel is connected to the processor board with a flat cable. Power supply and control signals are supplied from the processor. The front panel is divided in two sections:

- One board with Motorola 68HC05C4 processor, coders, and serial data interface.
- One matrix Keyboard with push buttons.

4.5 F9300-6 Centronics, Floppy, Printer interface option

4.5.1 Centronics interface option

This Centronics interface makes direct connection possible to external parallel printer.

- Address 0130 0180 to 0130 01A0
- Interrupt level 2

4.5.2 Floppy Disk drive interface option

Based on the circuit MCS3201 from Motorola.

- Address 0130 01C0 to 0130 01C7
- Interrupt level 4

Address	Read	Write
0130 01C0	Input register	-----
0130 01C2	-----	Digital output register
0130 01C4	Main status register	-----
0130 01C5	Data register	Data register
0130 01C7	Data input register	Disk control register

4.5.3 Printer Interface option

Internal graphic printer : Seiko LPT5446

- Address 0130 0140 to 0130 0160
- Interrupt level 2

4.6 F9300-7 Printer Controller option

Based on the LPT5000 series control chip set from Seiko instrument Inc

- PT501P01 CPU
- PT500GA1 Gate array
- Technical reference 39019-2234-01
- Address 0130 0100

4.7 F9300-8 Hard Disk option, PCMCIA III Controller

- Address 0130 0800 to 0130 0bff
- Interrupt level 5

4.8 93XX-Display

4.8.1 General Description

The raster scan display module is divided into five sections:

- Graphic processor
- Deflection
- Video
- Yoke
- Cathode ray tube

4.8.2 Basic Characteristics

- Nine inches diagonal monochrome, yellowish, orange.
- CRT anti-glare treated
- Non interlaced resolution of (X)810 x (Y)696 pixels at 60 Hz or 50 Hz frequency.

- Landscape vertical raster
- Electromagnetic deflection.
- Intensity control rise and fall time > 12 ns.
- Analog intensity input
- TTL synchronization input.
- Horizontal nominal size: 165 mm for X-on = 15.39 Ms.
- Horizontal size adjustment: > +/- 5 mm.
- Horizontal offset adjustment: +/- 5 mm.
- Vertical nominal size: 120 mm for Y-on = 14.5μs.
- Vertical size adjustment: > +/- 5 mm.
- Vertical offset adjustment: +/- 5 mm.
- X and Y differential non linearity: 10%.

The line deflection is vertical, from bottom to top. The field deflection is horizontal, from left to right and is resynchronized to the power line frequency.

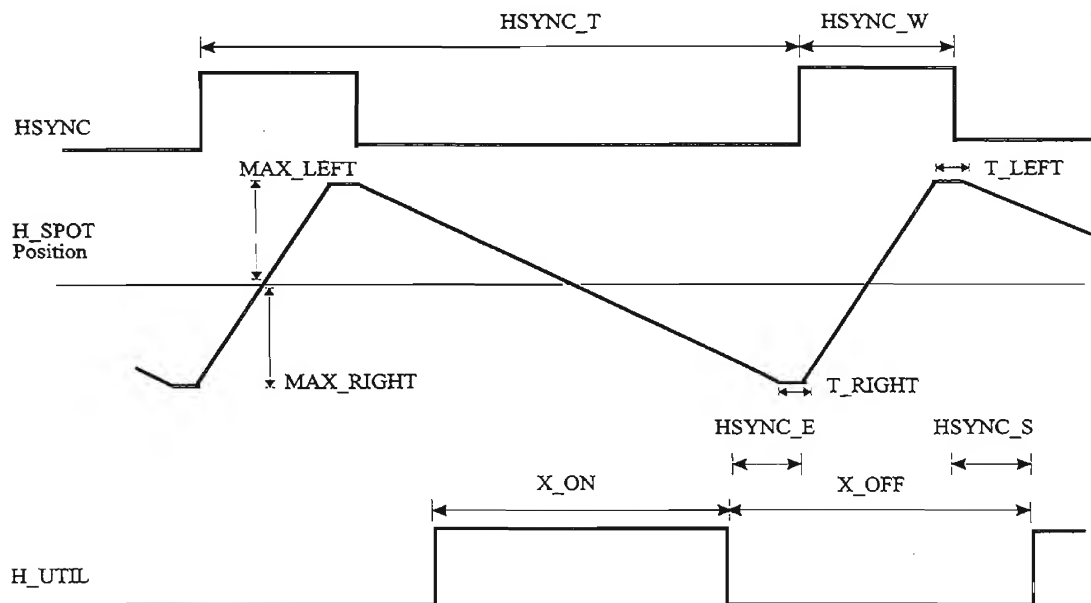

4.8.3 Horizontal Deflection

The horizontal deflection is synchronized to the 50 or 60 Hertz power line frequency. The on time display is the same for both frequencies, therefore the deflection is calculated for 60 Hz. The horizontal deflection is controlled by the HSYNC signal.

The trailing edge of HSYNC resets the horizontal spot position to a hardware predefined position at the left side of the screen: MAX_left. When ever HSYNC is high, the spot stays at this position.

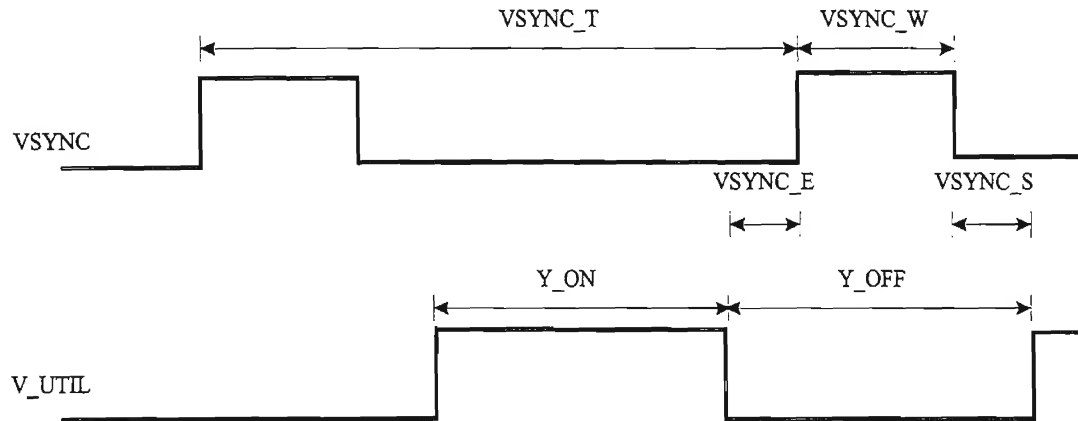

The falling edge of HSYNC starts the horizontal deflection ramp. The ramp has the same rate for either 50 or 60 Hertz frequency.

When ever HSYNC is low, the horizontal deflection will rise left to right, until HSYNC becomes high, or the system has reached the maximum right position (MAX_RIGHT).

4.8.4 Vertical Synchronization

The timing of both VSYNC and HSYNC is synchronized to the pixel clock (PCLK).

The pixel rate is 48 MHz.

4.8.5 Horizontal Resolution

	# of vertical line	Time in ms
HSYNC_T	842	15.998
HSYNC_W	22	0.418
HSYNC_E	4	0.076
HSYNC_S	6	0.114
X-ON	810	15.390
X-OFF	32	0.608

Values of the horizontal timing for the maximum field refresh frequency.

4.8.6 Vertical Resolution

	# of Pixels	Time in μ s
VSYNC_T	912	19.000
VSYNC_W	136	2.833
VSYNC_E	0	0.000
VSYNC_S	80	1.666
Y-ON	696	14.500
Y-OFF	216	4.500

4.9 PS9351 Power Supply

4.9.1 Power Supply Specifications

Input voltage	: 90 to 130 V or 180 to 260 V. Auto ranging line voltage.
Input frequency	: 47 Hz to 63 Hz.
Input rush current	: Max. 40 A peak at start up.
Environmental	: Operating temperature range 0 °C to + 50 °C Storage temperature range - 55 °C to + 80 °C Relative humidity from 5% to 95%.
Output voltages	: - 5.2 VDC, 13 amp Max. + 5.2 VDC, 14 amp Max. - 15.1 VDC, 4.5 amp Max + 15.1 VDC, 4 amp Max.
Output adjustment	: +/- 5%.
Regulation	: +/- 1%.
Transient response	: recover to 1% of its final value within 500 µsec.
Ripple and noise	: Peak to peak value < 50 Mv
Hold up time	: 16 msec at full load
Output short circuit protection	: Yes.
Output over voltage protection	: Yes.
Input protection	: 6 amp fuses.
Thermal protection	: Yes.
Safety	: VDE 0806, IEC 380, 435, 950 & UL1012, 478, CSAC22.2#1402C
EMI	: VDE 0871 class A, FCC 20780 class A.

4.9.2 Power Supply Block Diagram

SECTION 5 Performance Verification**5.1 Introduction**

This chapter contains procedures suitable for determining if the 9374/M/L/TM Digital Storage Oscilloscope performs as warranted.

They check all the characteristics that are designated as warranted specifications in subsection 5.1.1. A more complete list of specifications is given in section 2.1.

Because they require time and suitable test equipment, you may not need to perform all of these procedures, depending on what you want to accomplish.

In the absence of the computer automated calibration system based on LeCroy Calibration Software (LeCalsoft), this manual performance verification procedure can be followed to establish a traceable calibration.

It is the calibrating entities responsibility to ensure that all laboratory standards used to perform this procedure are operating within their specifications and traceable to required standards if a traceable calibration certificate is to be issued for the 9374/M/L/TM Digital Storage Oscilloscope.

5.1.1 List of Warranted Specifications

The electrical warranted specifications are listed in this subsection.

Warranted specifications are described in terms of quantifiable performance limits which are warranted.

- Input Impedance
- Leakage Current
- Peak to Peak and RMS Average noise level
- Positive and Negative DC linearity
- Positive and Negative Offset
- Bandwidth
- Trigger Level
- Smart Trigger
- Time Base Accuracy
- Overshoot and Rise Time
- Probe Calibrator
- Overload

5.2 Test Equipment Required

These procedures use external, traceable signal generators, DC precision power supply and digital multimeter, to directly check warranted specifications.

Instrument	Specifications	Recommended	Where used
Signal Generator (sine wave)	Frequency : .5 MHz to 2 GHz Frequency Accuracy : 1 PPM Amplitude : 5 V peak to peak	HP8648B or equivalent	5.9.1 5.11 5.12
Fast pulse Generator	Rise time < 70 psec	Picosecond TD1107 B or equivalent	5.13
Sine Wave Generator	Frequency : 5 KHz Amplitude : 6 V peak to peak	LeCroy LW420 or equivalent	5.10
DC precision Power Supply	Amplitude : 10 V, DC Accuracy : < 0.1 %	Tektronix PS5004 or equivalent	5.7, 5.8 5.15
Digital Multimeter	4 digits	Keithley 199 or equivalent	5.4 5.5
10:1 Passive Probe	500 MHz , 10 M Ω	LeCroy PP005	5.9.1.b
Cable	BNC, 50 Ω , length 20 cm, 1ns (7.87 inches)	LeCroy 480232001	5.10.3 5.10.4
Cable	BNC, 50 Ω , length 100 cm, 5 ns (39.37 inches)	LeCroy 480020101	5.XX
Attenuator	50 Ω , 20 dB 1% accuracy	Suhner	5.7
Attenuator	1 M Ω , 20 dB 1% accuracy	Suhner	5.7
Attenuator	50 Ω , 3 dB 1% accuracy	Suhner	5.10
Terminator	50 Ω Feed through, 1% accuracy	Suhner	5.13
BNC T adapter	BNC, 50 Ω , T adapter	LeCroy 402222002	5.10.3 5.10.4

Table 5-1 : Test Equipment

5.3 Turn On

If you are not familiar with operating the 9374/M/L/TM oscilloscope, read the operator's manual.

- Switch on the power using the power switch on the rear panel and verify :
- The display turns on after about 10 seconds and is stable
- The range of intensity and grid intensity is reasonable
- Wait for about 10 minutes for the scope to reach a stable operating temperature.

5.4 Input Impedance

Specifications

DC $1.00\text{ M}\Omega \pm 1\%$

AC $1.11\text{ M}\Omega \pm 2\%$

DC $50\text{ }\Omega \pm 1\%$

5.4.1 Procedure

The impedance values for $50\text{ }\Omega$ and $1\text{ M}\Omega$ couplings are measured, with a high precision digital multimeter.

5.4.1.a DC $1\text{ M}\Omega$

- Set DSO Channel 1 : **On**
- Input Coupling : **DC $1\text{ M}\Omega$**
- Input gain : **50 mV/div.**
- Trigger on : **Channel 1**
- Trigger mode : **Auto**
- Time base : **50 $\mu\text{sec/div.}$**

☐ AUTO

- Measure the impedance using a DMM with sense : must be $1.00\text{ M}\Omega \pm 1\%$.
- Repeat the above test for input volt/div. of **200 mV**.

5.4.1.b AC 1MΩ

- Set DSO Channel 1 : **On**
- Input Coupling : **AC 1 MΩ**
- Input gain : **50 mV/div.**
- Trigger on : **Channel 1**
- Trigger mode : **Auto**
- Time base : **50 μsec/div.**

26-Feb-96

16:28:34

- Measure the impedance using a DMM with sense : must be **1.11 MΩ ± 2%**.
- Repeat the test for input volt/div. of **200 mV**, the impedance must be **1.00 MΩ ± 2%**.

5.4.1.c DC 50Ω

- Set DSO Channel 1 : **On**
- Input Coupling : **DC 50Ω**
- Input gain : **50 mV/div.**
- Trigger on : **Channel 1**
- Trigger mode : **Auto**
- Time base : **50 μsec/div.**

26-Feb-96
16:30:50

- Measure the impedance using a high precision DMM with sense : must be **50 Ω ± 1%**
- Repeat the above test for input volt/div. of **200 mV**.
- Repeat steps 5.4.1.a, 5.4.1.b and 5.4.1.c for Channel 2, Channel 3 and Channel 4.

5.4.2 External Trigger Input Impedance

5.4.2.a DC 1MΩ

- Set Trigger on : **EXT**
- Trigger mode : **Auto**
- Coupling Ext : **DC**
- External : **DC 1MΩ**
- Time base : **50 μsec/div.**

26-Feb-96
16:33:29

- Measure the impedance using a high precision DMM : must be **1.00 MΩ ±1%**.

5.4.2.b DC 50Ω

- Set Trigger on : **EXT**
- Trigger mode : **Auto**
- Coupling Ext : **DC**
- External : **DC 50Ω**
- Time base : **50 μsec/div.**

26-Feb-96
16:34:33

- Measure the impedance using a high precision DMM with sense : must be **50 Ω ± 1%**.
- Repeat steps 5.4.2.a, for Ext/10, and check as above.

5.4.3 Internal Protective Resistor Verification

With any time base and gain, set DSO as follows :

- Input Coupling : **Grounded**
- Check with a high precision DMM : input impedance must be $1\text{ M}\Omega \pm 2\%$.

- Repeat the above test for Channel 2, Channel 3 and Channel 4.

5.5 Leakage Current

Specifications

DC 1 M Ω , AC 1 M Ω , DC 50 Ω : ± 1 mV

5.5.1 Procedure

The leakage current is tested by measuring the voltage across the input of each channel.

- Set DSO Ch1 : **On**
- Input Coupling : **DC 50 Ω**
- Input gain : **50 mV/div.**
- Trigger on : **Channel 1**
- Trigger mode : **Auto**
- Time base : **10 μ sec**

- Connect a high precision DMM to Channel 1, and verify that the reading is not larger than ± 1 mV.
- Repeat the above test for input volt/div. of **200 mV**.
- Repeat the procedure for **1M Ω DC** and **1M Ω AC**.
- Repeat step 5.5.1 for Channel 2, Channel 3, Channel 4 and External .

5.6 Average Noise Level

Description

The 9374/M/L/TM inputs average noise level is tested at 10 mV/div., with 0 mV offset. This is to verify the proper operation of the main board, front-end and ADC's. The scope parameters functions are used to measure the RMS and Peak amplitude of the noise.

5.6.1 Peak to Peak Noise

Specifications

< ± 7.2 mV Peak to Peak at 10 mV/div.

5.6.1.a DC 1M Ω

Procedure

- With no signal connected to the inputs, set 9374/M/L/TM DSO settings as follows :
- Turn on traces : **Ch1, Ch2, Ch3, Ch4**
- Display setup : **Standard, Dot Join on, Persistence off, Single grid**

Section 5 Performance Verification

- Input Coupling : **DC 1M Ω**
- V/div. offset : **Normal**
- Probe atten : **X1**
- Global BWL : **Off**
- Input gain : **10 mV/div.**
- Trigger setup : **Edge**
- Trigger on : **1**
- Coupling 1 : **DC**
- Slope 1 : **Pos**
- Holdoff : **Off**
- Trigger Mode : **Auto**
- Timebase : **20 msec/div.**
- Channel use : **4**
- Record up : **50 K**

5.6.2.b AC 1M Ω

- Select Ch1, Ch2, Ch3 & Ch4 : AC 1M Ω
- Input gain : 10 mV/div.
- Timebase : 10 μ sec/div.
- Check after at least 50 sweeps that the high Sdev readout is less than $\pm 720 \mu$ V, corresponding to **0.9% of full scale**.

5.6.2.c DC 50 Ω

- Select Ch1, Ch2, Ch3 & Ch4 : DC 50 Ω
- Input gain : 10 mV/div.
- Set Timebase : 50 μ sec/div.
- Check after at least 50 sweeps that the high Sdev readout is less than $\pm 720 \mu$ V, corresponding to **0.9% of full scale**.

- Repeat the tests for Timebase : 10 μ sec/div and check as above.

5.6.3 Inputs Grounded

With no cable plugged into scope, set the DSO as follows :

- Turn on trace : **Channel 1, Channel 2, Channel 3 & Channel 4**
- Input Coupling : **DC 50 Ω**
- Input gain : **10 mV/div.**
- Offset : **Zero**
- Trigger on : **Channel 1, DC**
- Trigger mode : **Auto**
- Timebase : **10 μ sec/div.**
- Channel use : **4**
- Record up : **50 K**
- Turn off trace : **Channel 1, Channel 2, Channel 3 & Channel 4**

- Turn on trace : **A, B, C, D**
- Select Math Setup
- For Math : **Use at most 5000 points**
- Redefine A, B, C, D : **Channel 1, Channel 2, Channel 3 & Channel 4**
- Use Math ? : **Yes**
- Math Type : **Average**
- Avg Type : **Summed**
- For : **1000 sweeps**

- Cursors/Measure : **Parameters**
- Mode : **Custom**
- Statistics : **off**
- Change parameters
- On line 1 : **Measure mean of A**
- On line 2 : **Measure mean of B**
- On line 3 : **Measure mean of C**
- On line 4 : **Measure mean of D**

- Check after at least 100 sweeps that the **mean** value of **A, B, C & D** is less than **± 1.6 mV**, corresponding to $\pm 2\%$ of full scale.

- Switch Channel 1, Channel 2, Channel 3 & Channel 4 between coupling **DC 50 Ω** and **Grounded**.
- Check after at least 100 sweeps that the **mean** value of **A, B, C & D** is less than **± 1.6 mV**, corresponding to $\pm 2\%$ of full scale.

- Set coupling all Channel : **DC 1M Ω**
- Check after at least 100 sweeps that the **mean** value of **A, B, C & D** is less than **± 1.6 mV**, corresponding to $\pm 2\%$ of full scale.

- Switch all Channel between coupling **DC 1M Ω** and **Grounded**.
- Check after at least 100 sweeps that the **mean** value of **A, B, C & D** is less than **± 1.6 mV**, corresponding to $\pm 2\%$ of full scale.

5.7 DC Linearity

Specification

$\leq \pm 5\%$ of full scale at 2mV/div, with 0 mV offset.
 $\leq \pm 3\%$ of full scale at 5mV/div, with 0 mV offset.
 $\leq \pm 2\%$ of full scale at 10mV/div and above.

5.7.1 Description

This test measures the DC Accuracy within the gain range specified.
 The parameters Std voltage are used to measure the amplitude of the DC input signal.

5.7.1.a DC 50 Ω

Procedure

- Turn on trace : **Ch1**
- Display setup : **Standard, Persistence off, Dot join on, Single grid**
- Input Coupling : **DC 50 Ω**
- V/div. offset : **Normal**
- Global BWL : **Off**
- Probe atten : **X1**
- Input offset : **0.0 mV**
- Input gain : **from 2mV/div to 5 V/div. (see table 5-2 and 5-3)**

- Trigger setup : **Edge**
- Trigger on : **1**
- Coupling 1 : **DC**
- Slope 1 : **Pos**
- Mode : **Auto**
- Holdoff : **Off**

- Timebase : **2 msec/div.**
- Channel use : **4**
- Record up : **50 K**

- Turn on trace : **A**
- Select Math Setup : **Use at most 5000 points**
- For Math : **Use at most 5000 points**
- Redefine A : **Use at most 5000 points**
- Use Math ? : **Yes**
- Math Type : **Average**
- Avg Type : **Summed**
- For : **1000 sweeps**
- Of : **Channel 1**

- Turn off trace : **Channel 1**

- Cursors/Measure : **Parameters**
- Mode : **Std Voltage**
- Statistics : **off**
- on displayed trace : **A**

5.7.1.a.1 Positive DC Linearity

- For the ranges **2 mV/div. to 1 V/div.**, from the high precision voltage source, apply to Channel 1 : **+ 3 major screen divisions.**
- For the low sensitivities : **2 mV, 5 mV, 10 mV, 20 mV and 50 mV/div.**, use a **50 Ohm 20 dB** attenuator.

5.8 Offset

5.8.1 Description

The maximum allowed offsets depend on the sensitivity as described in the specifications, and is tested at 2 mV and 5 mV range.

Specifications

± 400 mV : for the range 2mV/div.
 ± 1 V : for 5 mV/div., 10 mV/div., 20 mV/div., 50 mV/div.,
 ± 10 V : for 100 mV/div., 200 mV/div., 500 mV/div., 1 V/div (50 Ω)
 ± 100 V : for (1 M Ω), 1 V/div., 2 V/div., 5 V/div., 10 V/div.

5.8.1.a Negative Offset Control Procedure

Set the DSO as follows :

- Turn on trace : **Channel 1**
- Display setup : **Standard, Persistence off, Dot join on, Single grid**
- Input Coupling : **DC 1M Ω**
- V/div. offset : **Normal**
- Global BWL : **Off**
- Probe atten : **X1**
- Input gain : **5 mV**
- Trigger setup : **Edge**
- Trigger on : **1**
- Coupling 1 : **DC**
- Slope 1 : **Pos**
- Mode : **Auto**
- Holdoff : **Off**
- Timebase : **2 msec/div.**
- Channel use : **4**
- Record up : **50 K**
- Turn on trace : **A**
- Select Math Setup
- For Math : **Use at most 5000 points**
- Redefine A
- Use Math ? : **Yes**
- Math Type : **Average**
- Avg Type : **Summed**
- For : **1000 sweeps**
- Of : **Channel 1**
- Turn off trace : **Channel 1**
- Cursors/Measure : **Parameters**
- Mode : **Std Voltage**
- Statistics : **off**
- On displayed trace : **A**

- From the high precision voltage source PS5004, apply to Channel 1 + 1 V.
- Using the offset control, move Channel 1 trace through the entire range until the maximum offset value is reached : - 1 V.
- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.
- Press clear sweeps.
- Check after at least 100 sweeps that the mean (A) parameter readout is : minimum + .985 V, maximum + 1.015 V. (see table 5-5).

Range	Conditions of Test		Offset Control	Mean Parameter Reading	
Volts/div Control	PS Output	9374/M/L/TM Input	9374/M/L/TM Offset	Minimum Value,	Maximum Value,
5 mV	+ 1 V	+ 1 V	- 1 V	+ .985 V	+ 1.015 V
2 mV	+ 400 mV	+ 400 mV	- 400 mV	+ 392 mV	+ 408 mV

Table 5-5 : Negative offset control

Section 5 Performance Verification

- Select Input Coupling : **DC 50Ω**
- Input gain : **5 mV**
- Press clear sweeps
- Check after at least 100 sweeps that the mean (A) parameter readout is : minimum + **.985 V** , maximum + **1.015 V**.
- Set input gain to **2 mV/div** from the high precision voltage source, apply to Channel 1 the following voltage value : + **400 mV**.
- Using the offset control, move the Ch1 trace through the entire range until the following offset value is reached : - **400 mV**.
- Press clear sweeps
- Check after at least 100 sweeps that the mean (A) parameter readout is : minimum + **392 mV**, maximum + **408 mV** (see table 5-5).

- Repeat step 5.8.1.a for Channel 2, Channel 3 and Channel 4 substituting channel controls and input connector.

5.8.1.b Positive Offset Control Procedure

Set the DSO as in 5.8.1.a:

- Input Coupling : **DC 1M Ω**
- Channel 1 input gain : **5 mV**
- From the high precision voltage source PS5004, apply to Channel 1 - 1 V .
- Using the offset control, move Channel 1 trace through the entire range until the maximum offset value is reached : **+ 1 V**.
- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.
- Check after at least 100 sweeps that the mean (A) parameter readout is :
minimum - **.985 V**, maximum - **1.015 V**. (see table 5-6).

Range	Conditions of Test		Offset Control	Mean Parameter Reading	
Volts/div	PS	9374/M/L/TM	9374/M/L/TM	Minimum Value,	Maximum Value,
Control	Output	Input	Offset		
5 mV	- 1 V	- 1 V	+ 1 V	- .985 V	- 1.015 V
2 mV	- 400 mV	- 400 mV	+ 400 mV	- 392 mV	- 408 mV

Table 5-6 : Positive offset control

Section 5 Performance Verification

- Select Input Coupling : **DC 50Ω**
- Input gain : **5 mV**
- Press clear sweeps
- Check after at least 100 sweeps that the mean (A) parameter readout is :
minimum - **.985 V** , maximum - **1.015 V**.
- Set input gain to **2 mV/div** from the high precision voltage source, apply to Channel 1 the following voltage value : **- 400 mV**.
- Using the offset control, move the Ch1 trace through the entire range until the following offset value is reached : **+ 400 mV**.
- Press clear sweeps
- Check after at least 100 sweeps that the mean (A) parameter readout is :
minimum - **392 mV**, maximum - **408 mV** (see table 5-6).

- Repeat step 5.8.1.b for Channel 2, Channel 3 and Channel 4 substituting channel controls and input connector.

5.9 Bandwidth

5.9.1 Description

The purpose of this test is to ensure that the entire system has a bandwidth of at least 1 GHz . An external source is used as the reference to provide a signal where amplitude and frequency are well controlled. A serious measurement of the bandwidth requires the use of a source whose amplitude does not change with frequency.

The LeCroy calibration software corrects for the measured amplitude variation of the generator used. Generators can have errors of - 1 dB above 500 MHz. The non flatness of the generator should be taken into consideration.

Specifications

DC to at least 1 GHz (- 3 dB) at 10 mV/div. and above.

DC to at least 400 MHz at 5 mV/div.

DC to at least 150 MHz at 2 mV/div.

5.9.1.a DC 50 Ω

Procedure

- Turn on trace : **Ch1**
 - Display setup : **Standard, Persistence off, Dot join on, Single grid**
 - Input Coupling : **DC 50 Ω**
 - V/div. offset : **Normal**
 - Global BWL : **Off**
 - Probe atten : **X1**
 - Input gain : **50 mV/div.**
 - Offset : **0 mV**
 - Trigger setup : **Edge**
 - Trigger on : **Line**
 - Slope Line : **Pos**
 - Mode : **Norm or Auto**
 - Timebase : **10 μ sec/div.**
 - Channel use : **4**
 - Record up : **50 K**
 - Press Cursors/Measure: **Parameters**
 - Mode : **Custom**
 - Statistics : **off**
 - Change parameters : **Measure**
 - On line 1 : **sdev of 1**
 - On line 2 : **freq of 1**
- Connect a HP8648B sine wave generator to Channel 1, set the frequency to **500 KHz**, adjust the generator output amplitude to get on DSO : **sdev(1) = 80 mV.**

5.10 Trigger Level

5.10.1 Description

The trigger capabilities are tested for several cases of the standard edge trigger :

- Channel (internal), and External Trigger sources
- Three DC levels : -3, 0, +3 major screen divisions
- DC coupling
- Positive and negative slopes

5.10.2 Channel (internal)

The horizontal and vertical errors for a trigger at 0 v threshold are determined by comparing the crossing point of the same sine wave at two different amplitudes.

- Setup any sine wave generator capable of generating sine waves of **1 KHz, 4V pkpk**.
- Connect the generator output to Channel 1

- Turn on trace : **Ch1**
- Input Coupling Ch 1 : **DC 50 Ω**
- V/div. offset : **Normal**
- Input gain : **.5 V/div.**
- Input offset : **0 mV**
- Trigger setup : **Edge**
- Trigger on : **1**
- Coupling 1 : **DC**
- Slope 1 : **Pos**
- Set Trigger level : **DC 0.0 mV**
- Mode : **Single**
- Pre-Trigger Delay : **50 %**
- Timebase : **.1 msec/div.**
- Channel Use : **4**
- Record up to : **50 K samples**

- Adjust the sine wave generator's output amplitude to get **8 divisions peak to peak**, corresponding to a **4 V** amplitude.
- It is important that the offset of the input is set to **zero mV**, use show status and acquisition status to verify.

- Display setup : **Dot join Off**
- Set **Persistence On**, and acquire few sweeps in Single Trigger mode.
- Connect a **3 dB attenuator**, and acquire few more sweeps in Single mode.

- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the " cursor position " knob, to move the marker at the **horizontal crossing point** of the two sine waves.

- Check that the **time** difference obtained between the marker and the trigger is within **$\pm 20 \mu \text{ sec}$** . The time readout is below 0.50 V in the icon **1**, at top left.

5.10.4 External /10 Trigger

Specifications

External trigger range : DC \pm 5 V

Procedure

- Connect the output of the generator to External input and to Channel 2 via a coaxial T-connector. The cable length from External to Channel 2 must be short, at most 2 nsec.
- Set frequency : **1 KHz**
- Turn on trace : **Ch2**
- Input Coupling Ch 2 : **DC 50 Ω**
- V/div. offset : **Normal**
- Input gain : **1 V/div.**
- Input offset : **0 mV**
- Trigger setup : **Edge**
- Trigger on : **Ext10**
- Coupling Ext10 : **DC**
- Slope Ext10 : **Pos**
- External : **DC 1M Ω**
- Set Ext Trigger level : **DC 0.0 mV**
- Mode : **Single**
- Pre-Trigger Delay : **50 %**
- Timebase : **.1 msec/div.**
- Channel use : **4**
- Record up to : **50 K samples**
- Adjust the sine wave generator's output amplitude to get **8 divisions peak to peak**, corresponding to a **8 V** amplitude.
- It is important that the offset of the input is set to **zero mV**, use show status and acquisition status to verify.
- Display setup : **Dot join Off**
- Set **Persistence On**, and acquire few sweeps in Single Trigger mode.
- Connect a **3 dB attenuator**, and acquire few more sweeps in Single mode.
- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the " cursor position " knob, to move the marker at the **horizontal crossing point** of the two sine waves.
- Check that the **time** difference obtained between the marker and the trigger is within **\pm 20 μ sec**. The time readout is below 1 V in the icon **2**, at top left.

5.11.4 Trigger on Pulse Width > 100 nsec

- Adjust the generator frequency to **4 MHz**
- Pulse width : **> 100 nsec**
- Set Timebase : **50 nsec/div.**
- Check that the scope triggers.

- Switch to Width : **< 100 nsec**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal.
- Repeat all the above tests for Channel 2, Channel 3 and Channel 4 substituting channel controls and input connector, and check as above.

5.12 Time Base Accuracy

5.12.1 Description

An external sine wave generator of **1 MHz** with a frequency accuracy better than 1 PPM is used.

Specifications

500 MHz clock : accuracy : $\leq \pm 0.001 \%$ or $\leq \pm 10 \text{ PPM}$

5.12.2 500 MHz Clock Manual Verification Procedure

Setup a sine wave generator.

- Frequency : **1 MHz**
- Connect the generator output to Channel 1
- Turn on trace : **Ch1**
- Display setup : **Standard, Persistence off, Dot join on, Single grid**
- Input Coupling : **DC 50 Ω**
- V/div. offset : **Normal**
- Probe atten : **X1**
- Input gain : **.5 V/div.**
- Trigger setup : **Edge**
- Trigger on : **1**
- Coupling 1 : **DC**
- Slope 1 : **Pos**
- Level 1 : **0.5 V**
- Mode : **Norm**
- Holdoff : **Off**
- Delay : **0 %**
- Timebase : **.5 $\mu\text{sec/div.}$**
- Channel use : **4**
- Record up to : **50 K**
- Adjust the generator output amplitude and Ch1 offset to get a five divisions peak to peak amplitude sine wave.
- Store Channel 1 in Memory 1
- Set Post-trigger delay to **5.00 msec**

This allows the accuracy of the time base clock to be checked **5000 periods** after the trigger point.

5.14 Probe Calibrator Verification

Specifications

Amplitude : 50 mV to 500 mV $\pm 2\%$ into 50Ω
: 50 mV to 1 V $\pm 2\%$ into 1 MΩ

Frequency : 500 Hz to 2 MHz $\pm 1\%$

Probe Calibrator Verification Procedure

- Connect the Probe Calibrator output to Channel 1, using a 5 nsec BNC cable
- Select : **Utilities**
- Press : **Cal BNC Setup**
- Mode : **Cal signal**
- Set Frequency : **500 Hz**
- Amplitude : **1 V (500 mV into 50 Ω)**

- Turn on trace : **Ch1**
- Display setup : **Standard, Persistence off, Dot join on, Single grid**
- Input Coupling : **DC 50 Ω**
- V/div. offset : **Normal**
- Probe atten : **X1**
- Input offset : **- 250 mV**
- Input gain : **100 mV/div.**

5.15 Overload

Specifications

1 Watt into 50 Ω : Overload < 17 seconds

Procedure

- Set the DSO as follows :
 - Display setup : **Standard, Persistence off, Dot join on, Single grid**
 - Input Coupling : **DC 50 Ω**
 - V/div. offset : **Normal**
 - Global BWL : **Off**
 - Probe atten : **X1**
 - Input offset : **- 3.5 V**
 - Input gain : **1 V/div.**
 - Trigger setup : **Edge**
 - Trigger on : **1**
 - Trigger level : **DC - 0.04 V**
 - Delay : **zero**
 - Coupling 1 : **DC**
 - Slope 1 : **Pos**
 - Mode : **Norm**
 - Holdoff : **Off**
 - Timebase : **2 sec/div.**
 - Channel Use : **4**
 - Record up to : **1000 samples**
- From Tektronix power supply PS5004, apply **7.07 V** (1 Watt) to Channel 1.
- Check that the overload trips, within **17** seconds.
- Set Timebase : **5 sec/div.**
- From Tektronix power supply PS5004, apply **5 V** (.5 Watt) to Channel 1
- Check that the overload doesn't trip for at least **30** seconds.
- Repeat the above tests for Channel 2, Channel 3 and Channel 4 substituting channel controls and input connector, and check as above.

5.16 Combining Channels

Channels can be combined to achieve more memory and more sampling rate by interleaving the ADC's in time. It is possible to achieve 2 GS/s and up to 8M record length (9374L) by means of a special adaptor call PP093.

- Set DSO Timebase : $.2 \mu\text{sec/div}$.
- Connect the **PP093** adaptor to Channel 2 and Channel 3 and check that :
 - The PP093 is identified on **Channel 2**
 - Channel 1, Channel 3 and Channel 4 are **disabled**
 - Channel 2 is set to **DC 50 Ω , X2**
 - Sampling rate is **2 GS/s**
- Connect the **Probe calibrator** output to **PP093** input using a 5 nsec BNC cable.
- Set Cal frequency to **2 MHz** and Amplitude to **1 V** into **1 M Ω**
- Turn on **trace 2** and check that :
 - A Square wave of 500 mV is displayed on Channel 2

SECTION 6 MAINTENANCE**6.1 Introduction**

This section contains information necessary to disassemble, assemble, maintain, calibrate and troubleshoot the LeCroy 9374, 9374M, 9374L and 9374TM digital oscilloscope.

6.2 Disassembly and Assembly Procedure

The disassembly and assembly procedures detailed below refer to the assembly and disassembly diagram 6.2.3, and the view of figures 6.1, 6.2, 6.3, 6.4, 6.5, 6.6 & 6.7. Please study the diagram and figures before attempting disassembly.

WARNING

Before removing any parts from the LeCroy 9374, be sure to read carefully the instructions referring to those parts, noting any precautions needed to avoid problems caused by mechanical behaviour, high voltage supplies, etc.

CAUTION

The usual precautions against static electricity are required (see 1.10)

6.2.1 Removal of the Upper Cover (5.14)

The top cover (5.14) is secured by two M4x5 screws (5.16) on both sides of the front panel assembly (2), and by two M4x8 screws (5.15) on the rear panel (3). Remove the screws and carefully slide the cover off the unit to the rear. Removal of the top cover gives access to the boards and parts listed in section 6.2.3.

6.2.2 Removal of the PS9351 Power Supply (4) and PS9370 Auxiliary Power Supply (5.12)**WARNING**

Ensure the line cord is disconnected. Remove the following:

- Top cover (6.2.1).
- One M4X8 screw (5.9) from left side of the bottom cover (1.1).
- Two M4X8 screws (5.1) from left side of the rear panel (3).

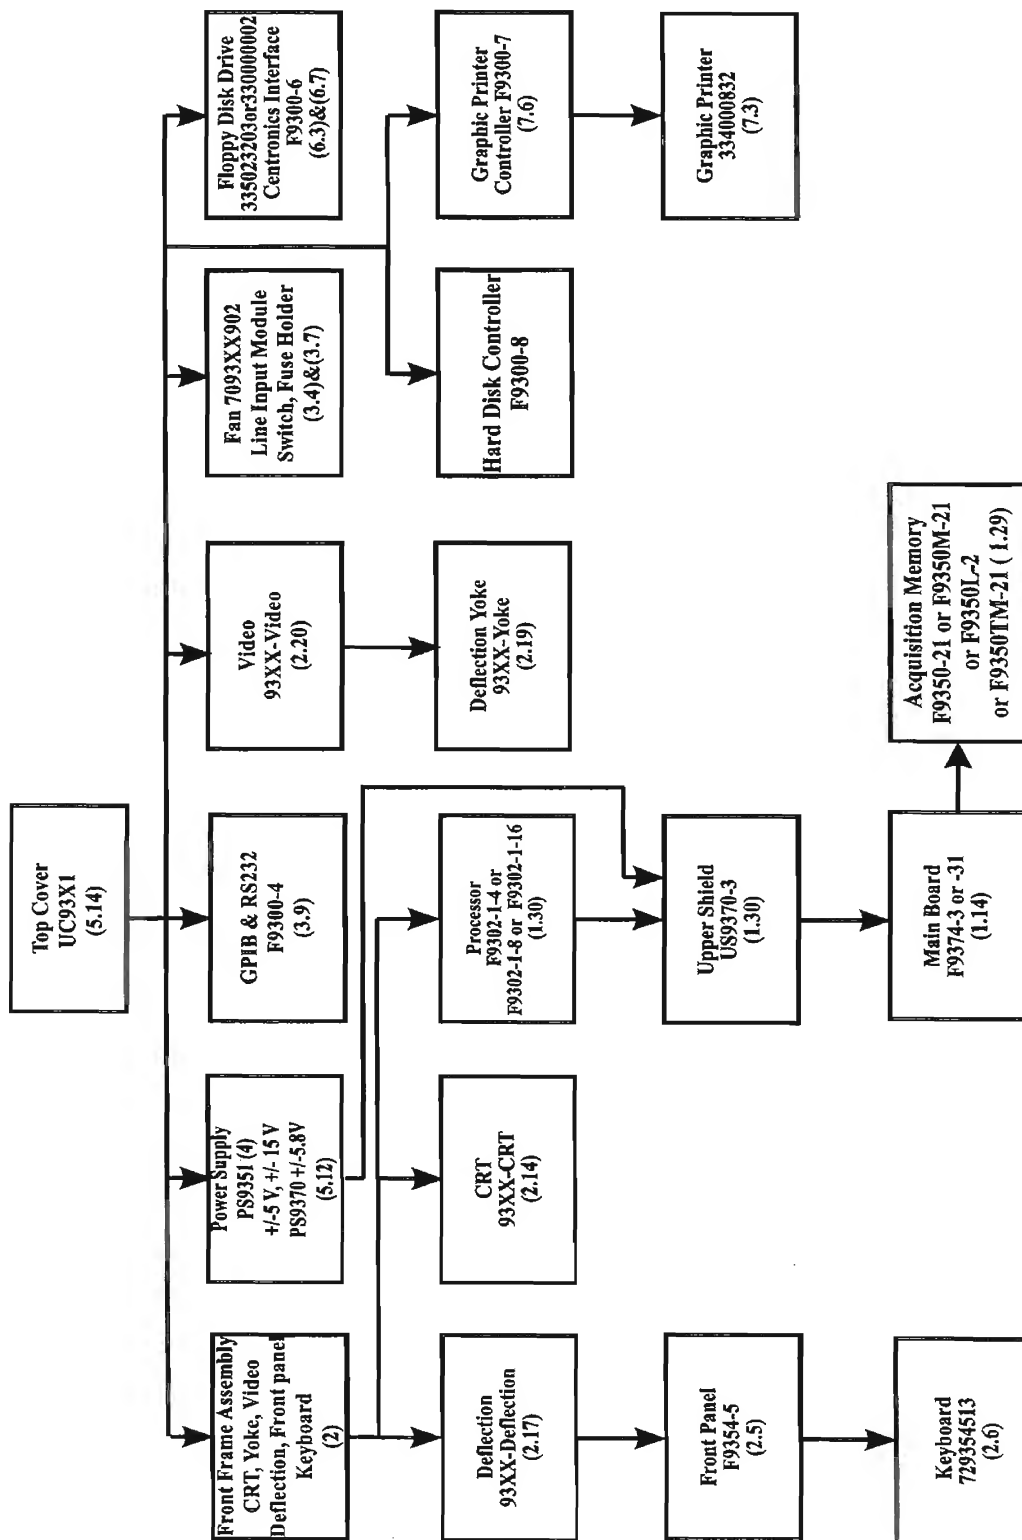

Disconnect the following:

- Base card power cable connector J1 & J6 from PS9370 connector J2(see figure 6.8).
- PS9351 line input cable (AC line, neutral, ground) from line input module (3.7) .
- Auxiliary power cable from optional internal graphic printer connector J4 (see figure 6.8).

The PS9351 power supply can now be removed vertically from the oscilloscope.
The PS9370 auxiliary power supply can be removed vertically from the main board connector J1/J2.

6.2.3 Disassembly and Assembly Diagram

Disassembly : If it becomes necessary to replace a board or a part, use the disassembly diagram to disassemble the unit. Any board can be removed if items higher in the diagram and connected by a line are already out.

Assembly : Reassemble the unit in the reverse order.

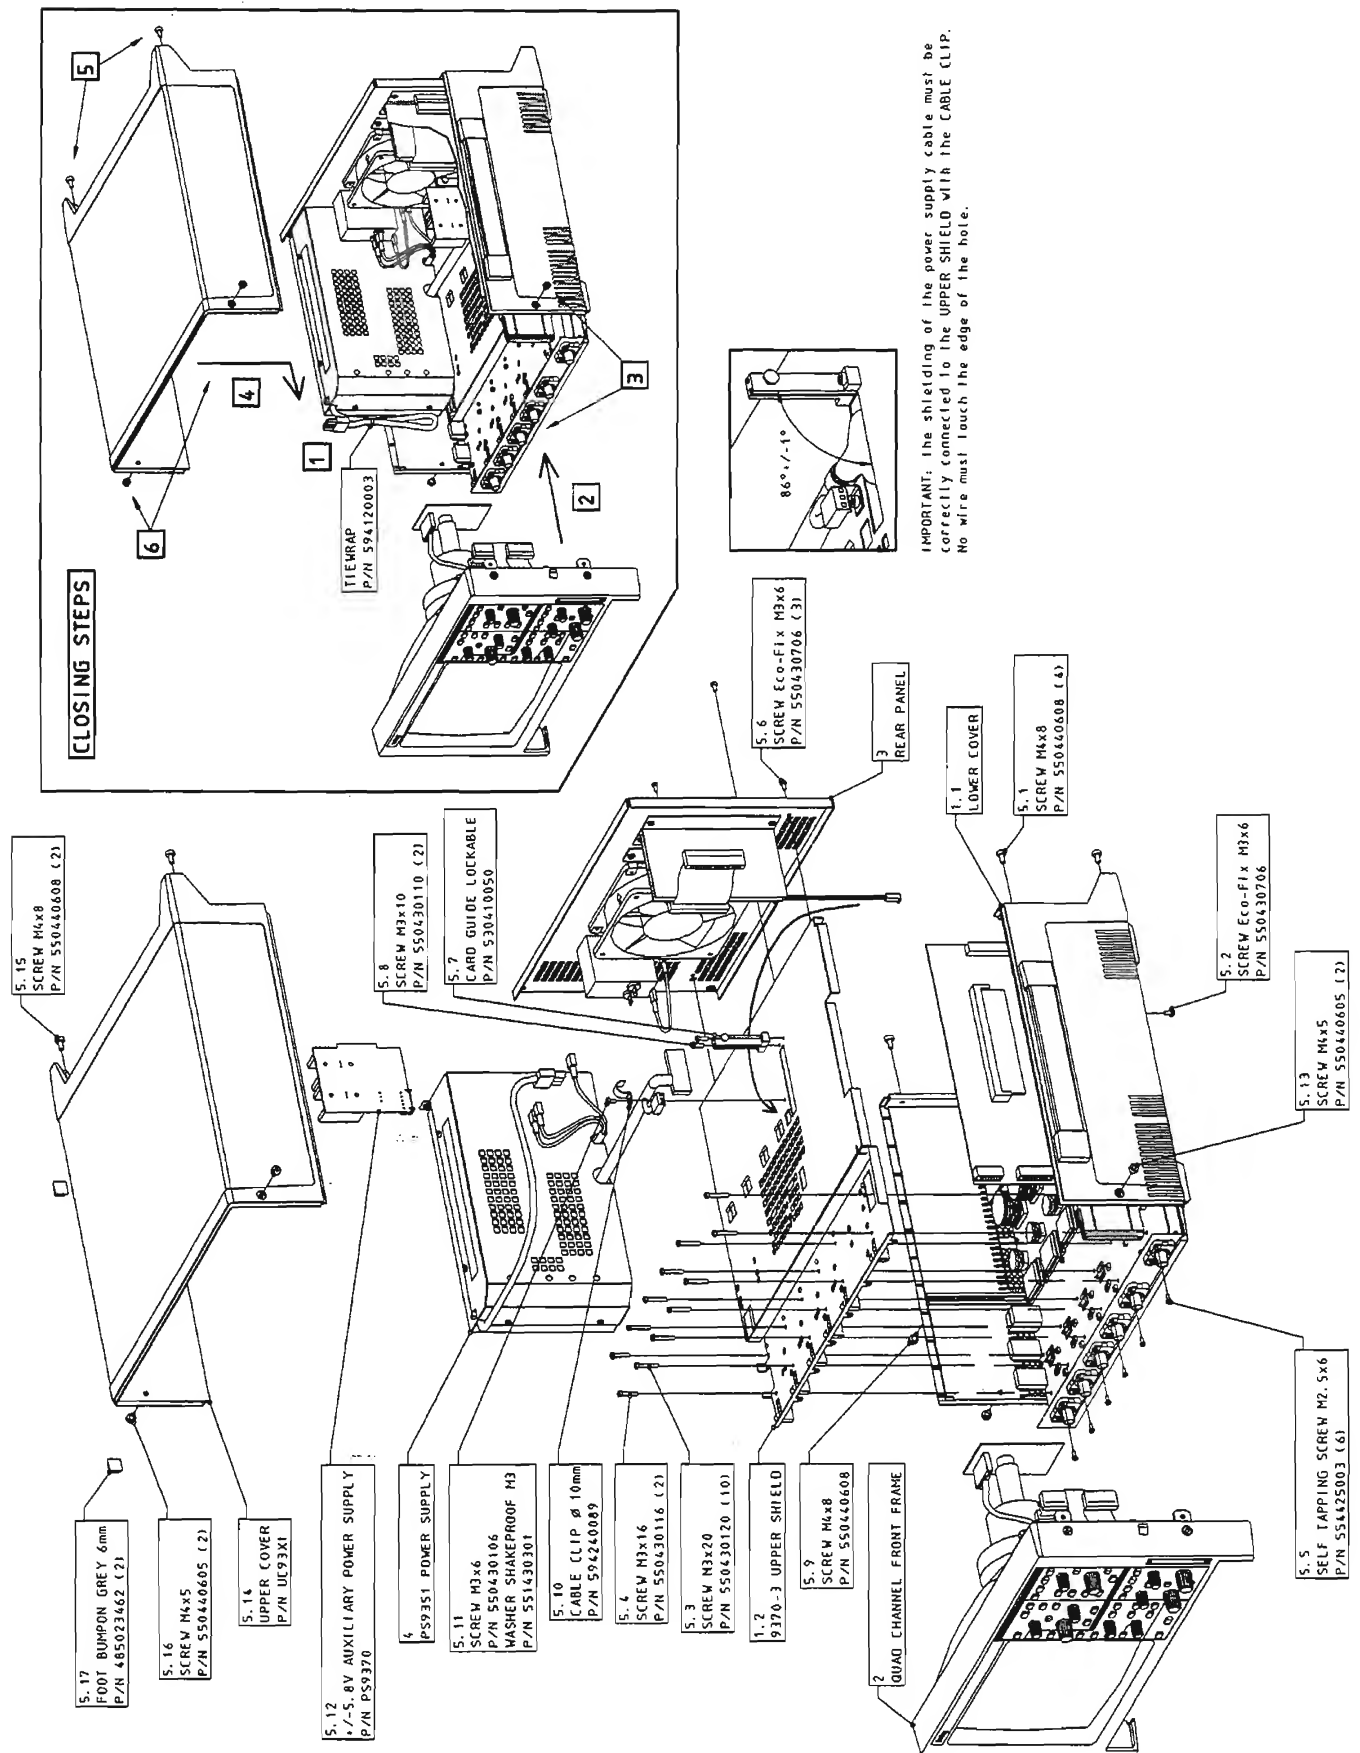

Figure 6.1 : 9374/M/L/TM Assembly

Figure 6.2 : 9374/M/L/TM Lower Cover Assembly

Figure 6.3 : 9374/M/L/TM Front Frame Assembly

Figure 6.4 : 9374/M/L/TM Rear Panel Assembly

6.2.4 Removal of the F9300-4 GPIB/RS232 Interface (3.9)

The GPIB/RS232 interface (3.9) is vertically mounted on the rear panel (3.1).

Remove the following:

- Top cover (6.2.1).
- Two M3x6 screws (3.17) and washers from the rear panel (3.1).
- Disconnect the flat cable (3.19) from the processor board (1.32) connector J5.

The GPIB/RS232 board can be removed forward from the rear panel.

6.2.5 Removal of the Fan (3.4)

Remove the following:

- Top cover (6.2.1)
- Four screws (3.6) from the rear panel (3.1).
- Disconnect the fan power cable from the main card F9374-31 connector J3.

The fan (3.4) part number : 7093XX902 can be removed from the unit.

CAUTION

Note the air flow, the fan extracts air from the unit and expels it.

6.2.6 Removal of the Line Input module (3.7)

WARNING

Disconnect the power cord.

Remove the following:

- Top cover (6.2.1).
- Two screws (3.8) from the rear panel.
- Disconnect the power cable from the power supply connector.
- Disconnect the earth cable (3.18).

The fuse holder assembly (3.7) can be removed from the rear panel (3.1).

6.2.7 Removal of the 93XX-Video (2.20)

- Remove the top cover (6.2.1).
- Disconnect the ground cable from CRT (black wire)
- Disconnect the monitor cable (2.21) from the deflection board, connector W301 & W302

Ease the video board (2.20) carefully toward the back of the DSO, until it is free.

6.2.8 Removal of the 93XX-Yoke (2.19)

- Remove the top cover (6.2.1).
- Remove the 93XX-video board (6.2.7).
- Disconnect the cable from the deflection board connector W201.
- Loose the screw on the yoke ring holder.

The deflection yoke (2.19) can be removed from the cathode ray tube (2.14).

6.2.9 Removal of the front frame Assembly (2)

Remove the following:

- Top cover (6.2.1)
- Two screws (5.13) that secure the front frame assembly (2) to the lower cover (1.1).
- Disconnect the front panel flat cable (2.11) from the processor (1.32) connector J4.
- Disconnect the deflection flat cable (2.22) from the processor board (1.32) connector J6.

The front frame assembly (2) with the CRT (2.14), yoke (2.19), video (2.20), deflection (2.17), front panel (2.7) and keyboard (2.6) can with care be removed forward from the unit.

CAUTION

Hold the CRT very carefully, or place soft padding under it.

6.2.10 Removal of the 93XX-Deflection (2.17)

The deflection board (2.17) is situated to the back of the front panel (2.5).

Remove the following

- Top cover (6.2.1).
- Front frame assembly (6.2.9).
- Disconnect the monitor cable (2.21) which lead to the video board (2.20), connector W301 and W302.
- Disconnect the cable from the deflection yoke, connector W201.
- Disconnect the EHT plug from the receptacle at the right side of the CRT (2.14).

WARNING

Touch the free end of the EHT cable to the ground, this ensures that no significant charge remains. The CRT must be discharged similarly, using a tool or a long screw driver which is first placed to the ground and on the CRT receptacle.

Remove the four M35x10 screws (2.18) that secure the deflection board to the plastic front frame.

The board (2.17) can now be removed from the unit.

6.2.11 Removal of the 93XX-CRT (2.14)

It is necessary to remove the front frame assembly (6.2.9). The CRT is secured to the plastic front frame by four screws (2.16).

- Remove the 93XX-video (6.2.7).
- Remove the 93XX-yoke (6.2.8).
- Disconnect the EHT cable from the deflection board. - Discharge the tube.
- Remove the four screws.

The CRT can now be removed from the front frame.

WARNING

Use care when handling the CRT. Avoid striking it on any object which may cause the tube to implode. Store the cathode ray tube face down on a soft surface.

To avoid electrical shock the CRT should be discharged after the 9374/M/L/T oscilloscope is powered OFF. After disconnecting the EHT plug, ground the CRT anode lead to the metallic display support, repeat the operation to fully dissipate the charge.

6.2.12 Removal of the F9354-5 Front Panel (2.5)

Remove the following:

- Upper cover (6.2.1).
- Front frame assembly (6.2.9).
- 93XX-deflection board (6.2.10).
- Four screws (2.12) that secure the front panel.

The front panel (2.5) with the keyboard (2.6) can be removed forward from the unit.

6.2.13 Removal of the Front Panel Keyboard (2.6)

Remove the following:

- Upper cover (6.2.1).
- Front frame assembly (6.2.9).
- 93XX-deflection board (6.2.10).
- F9354-5 front panel (6.2.12).
- The 11 rotary knobs (2.9 and 2.10). Take great care of the soft plastic
- One screw (2.8) that secures the keyboard to the front panel.
- Disconnect the flat ribbon cable from the front panel connector J2, and remove the keyboard P/N : 729354513.

CAUTION

When removing or installing the keyboard or the front panel, be careful of the fragile flat ribbon cable and connector.

6.2.14 Removal of the Processor (1.32)

The processor F9302-1-4 or F9302-1-8 or F9302-1-16 board is located along the right side of the instrument.

Remove the following:

- Top cover (6.2.1).
- Front frame assembly (6.2.9).
- Disconnect the flat cable (3.19) from the F9300-4 GPIB interface connector J5

The processor can be removed vertically from the main card (1.14) F9374-3 or -31 connector J1

CAUTION

Static electricity can damage components (RAM, Eproms, microprocessor...). Antistatic precautions are required.

6.2.15 Removal of the F9374-3 or -31 Main Card (1.14)

Remove the following:

- Top cover (6.2.1).
- Front frame assembly (6.2.9).
- Power supply (6.2.2), and PS9370 auxiliary power supply (5.12)
- Processor (6.2.14).

The main board with the upper shield (1.2) is horizontally mounted to the lower case cover (1.1).

- Remove the ten M3x20 screws (5.3), two M3x16 (5.4) and six M2.5x6 (5.5) that secure the upper shield (1.2) to the main board and front panel.
- Remove the two M4x8 (5.1) and one M3x6 (5.2) that secure the rear panel assembly (3) to the lower cover (1.1)
- Disconnect the fan cable from connector J3.

The upper shield (1.2) attached to the rear panel (3) can be removed forward from the board.

- Remove the five M3x6 screws (1.26), four M3x16 (1.27) and three M3x6 flat head screws (1.25) that secure the board to the lower cover (1.1).

The main board F9374-3 or -31 (1.14) with acquisition memory card (1.29), base shield (1.21) and card panel (1.15) can be removed from the scope.

CAUTION

Antistatic precautions are required.

6.2.16 Removal of the Handle (1.4)

The handle with two black end caps is secured to the right side of the lower cover (1.1) by two screws (1.5) and washers (1.6).

- Remove the upper cover (6.2.1), and processor board (6.2.14).

The handle can be removed from the lower case.

6.2.17 Removal of the Foot Support (1.8)

The two foot supports are clipped on the lower cover (1.1).

- Remove the foot (1.7) or the support (1.8) by inserting a small flat screwdriver under the support

6.2.18 Removal of the 93XX-FD01 Floppy Disk Drive Option

- Remove the upper cover (6.2.1).
- Disconnect the flat ribbon cable from the F9300-6 interface (see figure 6.5 & 6.6).
- Remove the two M3x6 screws that secure the floppy drive support to the upper cover.
- Remove the support 70FD01021 (See figure 6.5) or 70FD01091 (See figure 6.6)
- Remove the frame 70FD01031 (See figure 6.5 & 6.6) from the cover.
- Remove the four M2.5x4 screws that secure the floppy to the support

The floppy disk drive (6.3) can be removed from the frame.

6.2.19 Removal of the 93XX-GP01 Graphic Printer and F9300-7 Controller Option

- Remove the upper cover (6.2.1).
- Disconnect the power cable from the PS9351 power supply (see figure 6.7).
- Disconnect the flat ribbon cable (780791604) from the F9300-7 controller (see figure 6.7).
- Disconnect the flat ribbon cable (780721022) between the F9300-6 interface and F9300-7 controller.
- Remove the four M3x6 screws that secure the F9300-7 controller to frame (70GP01031).
- Remove the F9300-7 controller
- Remove the two M3x6 screws that secure the printer to the frame

The graphic printer (7.3) can now be removed from the upper cover.

6.2.20 Removal of the F9300-6 Centronics Interface Option

- Remove the upper cover (6.2.1).
- Remove the two M3x6 screws from the rear panel
- Disconnect the flat cable P/N : 780801015 from the F9300-4 GPIB/RS232 board (see figure 6.6 or 6.7).

The Centronics interface board can be removed forward from the rear panel.

Figure 6.7 : Graphic Printer Assembly

6.3 Software Upgrade Procedure

F9302-1-X processor board has one 8MB Flash Prom which contains the program memory and the character font used by the graphic processor of the raster scan display.

After any software change, a general instrument reset is mandatory. Simultaneously press the autsetup button, the top menu button and the return button.

6.3.1 Upgrading Firmware

LeCroy Corporation has a policy of continually improving and upgrading its products.

The 9374/M/L/T instrument is equipped with Flash Prom on processor board, the Software is upgraded to the latest version using either the Memory Card interface or the Floppy disk drive.

6.3.1.1 Upgrading Firmware from Memory Card

A single memory card containing the 93XX36XX.bin file in the Lecroy_P directory is required.

- Insert the card and cycle power to the scope. Once re-booted enter the **Utilities, Special Modes, Firmware Update** menu.

- Change the **Update From** control to **Card**
- Press **Update Program**.

The Software is then downloaded to the Flash Prom on the processor board.

5-Jun-96
11:32:05

Warning:

Reprogramming the Flash memory is a procedure to be performed with care.

Any loss of power during the update process could cause the scope to require factory service.

The update process requires a LeCroy supplied software update memory card or floppy disk. This contains the necessary information to update your scope software.

Note that once software has been updated it is not possible to revert to the previous software version.

□

6.3.1.2 Upgrading Firmware from Floppy

In order to update the scope firmware from floppy, two disks are required.

The first contains a **93XX36XX.bin** file in the Lecroy_P directory.

The second contains a **93XX36XX fla** file in the Lecroy_P directory

- Insert the first disk and cycle power to the scope. Once re-booted enter the **Utilities, Special Modes, Firmware Update** menu.
- Change the **Update From** control to **Floppy**
- Insert the second floppy disk and press **Update Program**.

The Software is then downloaded to the Flash Prom.

5-Jun-96 Press Button again to confirm

Floppy

Update
Program

Warning:

- Reprogramming the flash memory is a procedure to be performed with care.

Any loss of power during the update process could cause the scope to require factory service.

The update process requires a LeCroy supplied software update memory card or floppy disk. This contains the necessary information to update your scope software.

Note that once software has been updated it is not possible to revert to the previous software version.

6.3.2 Changing Software Options

The software option selection GAL is located on the processor board at location A49. Insert or replace the GAL to select new options. Make sure that the orientation notch is correctly aligned with the PCB.

6.3.3 Software Option Selection GAL

The following software options are available : (see section 2)

WP01	Advanced Math Firmware
WP02	Basic FFT Firmware
WP03	Parameter Distribution Analysis Firmware
CARD	Memory card
DDM	Disk Drive Measurements
PRML	Partial Response Maximum Likelihood
ORM	Optical Recording Measurement
MC01	PCMCIA Memory Card

6.3.4 Processor Board Exchange Procedure

The replacement board is supplied without any options. Therefore the existing GAL (Loc A49) must be transferred from the faulty board to the new board. After upgrading firmware or changing the software option, check that the scope boots correctly. Then check in the system summary, by using the show status button on the front panel, the software version, software options and serial number.

The serial number of the 9374/M/L/TM oscilloscope is loaded in the real time clock memory which is battery backed up. If it becomes necessary to replace the processor board, the serial number must be loaded in the memory of the new board by using LeCroy program " LeCalsoft " under GPIB remote control.

To run " LeCalsoft " type SKP.exe, in the main menu type S, and follow the instructions, use five digits to enter the serial number (i.e. 01490).

6.4 Equipment and Spare Parts Recommended for Service

6.4.1 Equipment

The following equipment is needed to provide the technician access to the 9374/M/L/TM subassemblies during repair and calibration (see Performance Verification section 5).

Instrument	Specifications	Recommended	Where used
Signal Generator (sine wave)	Frequency : .5 MHz to 2 GHz Frequency Accuracy : 1 PPM Amplitude : 5 V peak to peak	HP8648B or equivalent	5.9.1 5.11 5.12
Fast pulse Generator	Rise time < 70 psec	Picosecond TD1107 B or equivalent	5.13
Sine Wave Generator	Frequency : 5 KHz Amplitude : 6 V peak to peak	LeCroy LW420 or equivalent	5.10
DC precision Power Supply	Amplitude : 10 V, DC Accuracy : < 0.1 %	Tektronix PS5004 or equivalent	5.7, 5.8 5.15
Digital Multimeter	4 digits	Keithley 199 or equivalent	5.4 5.5
10:1 Passive Probe	500 MHz , 10 M Ω	LeCroy PP005	5.9.1.b
Cable	BNC, 50 Ω , length 20 cm, 1ns (7.87 inches)	LeCroy 480232001	5.10.3 5.10.4
Cable	BNC, 50 Ω , length 100 cm, 5 ns (39.37 inches)	LeCroy 480020101	5.XX
Attenuator	50 Ω , 20 dB 1% accuracy	Suhner	5.7
Attenuator	1 M Ω , 20 dB 1% accuracy	Suhner	5.7
Attenuator	50 Ω , 3 dB 1% accuracy	Suhner	5.10
Feed through	50 Ω , 1% accuracy	Suhner	5.13
BNC T adapter	BNC, 50 Ω , T adapter	LeCroy 402222002	5.10.3 5.10.4

6.4.2 Spare Parts

In order to make the repair of 9374/M/L/TM DSO's series at board level, a minimum stock of boards is at least one each:

- F9302-1-4 : Processor board for 9374
- F9302-1-8 : Processor board for 9374M and 9374TM
- F9302-1-16 : Processor board for 9374L

- F9350-21 : Acquisition memory for 9374
- F9350M-21 : Acquisition memory for 9374M
- F9350TM-21 : Acquisition memory for 9374TM
- F9350L-2 : Acquisition memory for 9374L

- F9374-3 or 31 : Main board for 9374, 9374M, 9374L, & 9474TM

- F9300-4 : GPIB/RS232 interface
- F9354-5 : Front panel with keyboard

- 93XX-Display : Raster monitor kit
- PS9351 : Power supply
- PS9350 : Auxiliary Power Supply

If the unit is equipped with the 93XX-FD01 option :

- F9300-6 : Floppy, Graphic printer, Centronics Interface
- 335023203 : Floppy disk drive
- or 330000002 : Floppy disk drive

If the unit is equipped with the 93XX-GP01 option :

- F9300-6 : Graphic printer, Floppy, Centronics Interface
- F9300-7 : Graphic printer controller
- 334000832 : LPT5446 Seiko Graphic printer

If the unit is equipped with the 93XX-HD01 option :

- F9300-8 : Hard disk Interface
- HDD02 : Hard disk drive

The other parts (fan, fuse holder, scope handle, covers, rear panel...) are not on the above list because they are very reliable parts and the probability of failure is very low.

6.5 Troubleshooting and Flow Charts

6.5.1 Introduction

The troubleshooting information contained in this section is intended for use by qualified personnel having a basic understanding of electronics (analog and digital). In order to simplify servicing and minimize downtime, the following list of possible symptoms, likely causes, and troubleshooting steps have been prepared.

The first step in troubleshooting is to check for obvious items like blown fuses.

The power supply is the next item to check before proceeding to more detailed troubleshooting, since noise or low power supply voltages can cause a variety of digital and analog problems.

6.5.2 Line Voltage Autoranging

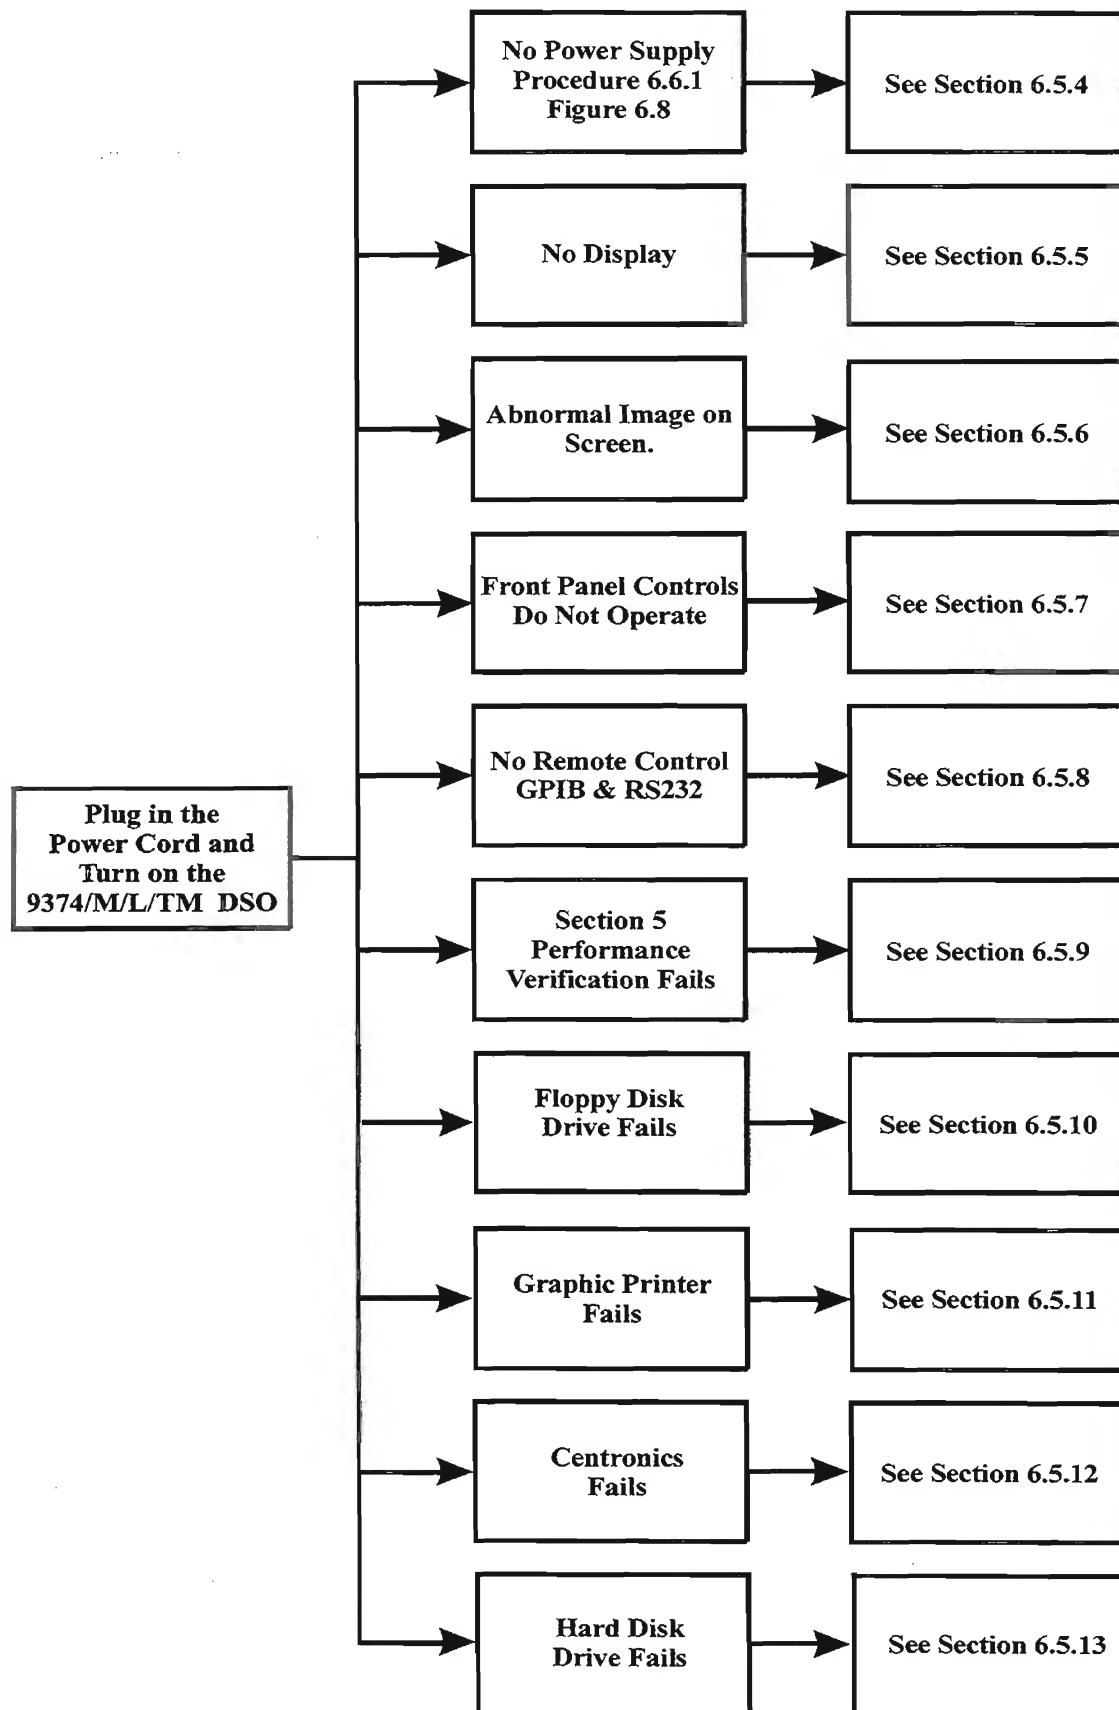

The 9374/M/L/TM oscilloscope operates from a 115 V (90 to 130 V) or 220 V (180 to 260 V) normal power source at 47 Hz to 63Hz.

No voltage selection is required since the instrument automatically adapts to the line voltage which is present. The instrument operates at line frequencies up to 440 Hz.

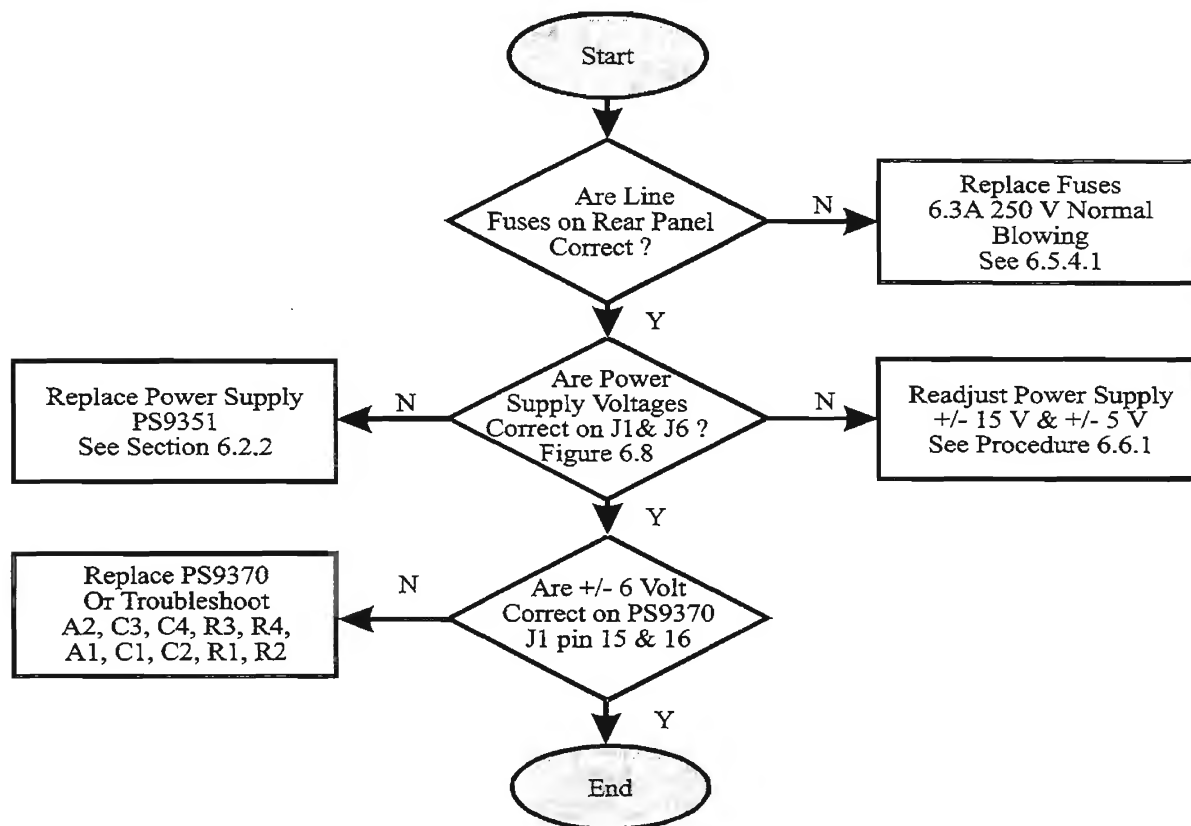

6.5.3 Initial Troubleshooting Chart

Most procedures in this section will allow troubleshooting down to the **BOARD LEVEL**.

Defective circuit boards will be repaired or exchanged by the regional LeCroy service office or the local representative (see section 1.4).

6.5.4 No Power Supply

6.5.4.1 Line Fuses Replacement

The power supply of the oscilloscope is protected against short circuits and overload by means of two 6.3A / 250 V fuses located above the main plugs.

WARNING

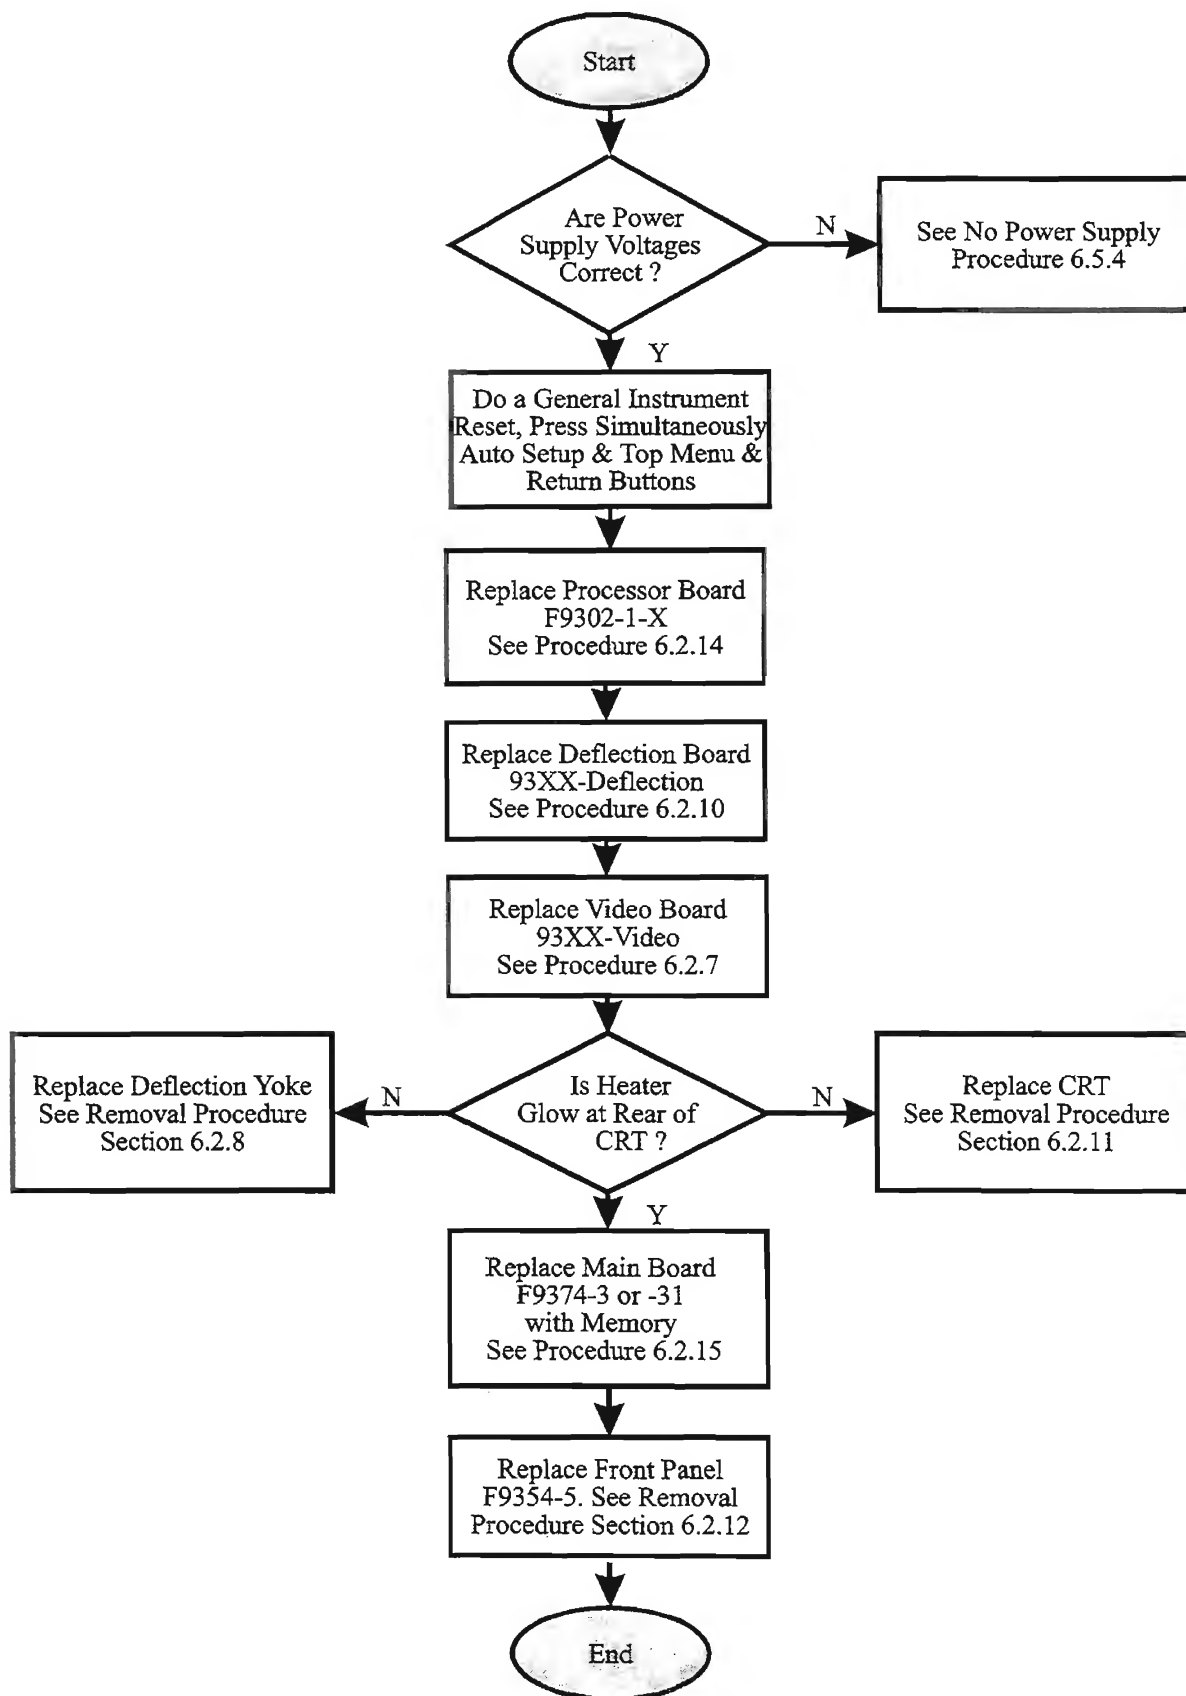

Disconnect the instrument from the power line and from other equipment before replacing fuses.

To replace line fuses, proceed as follow :

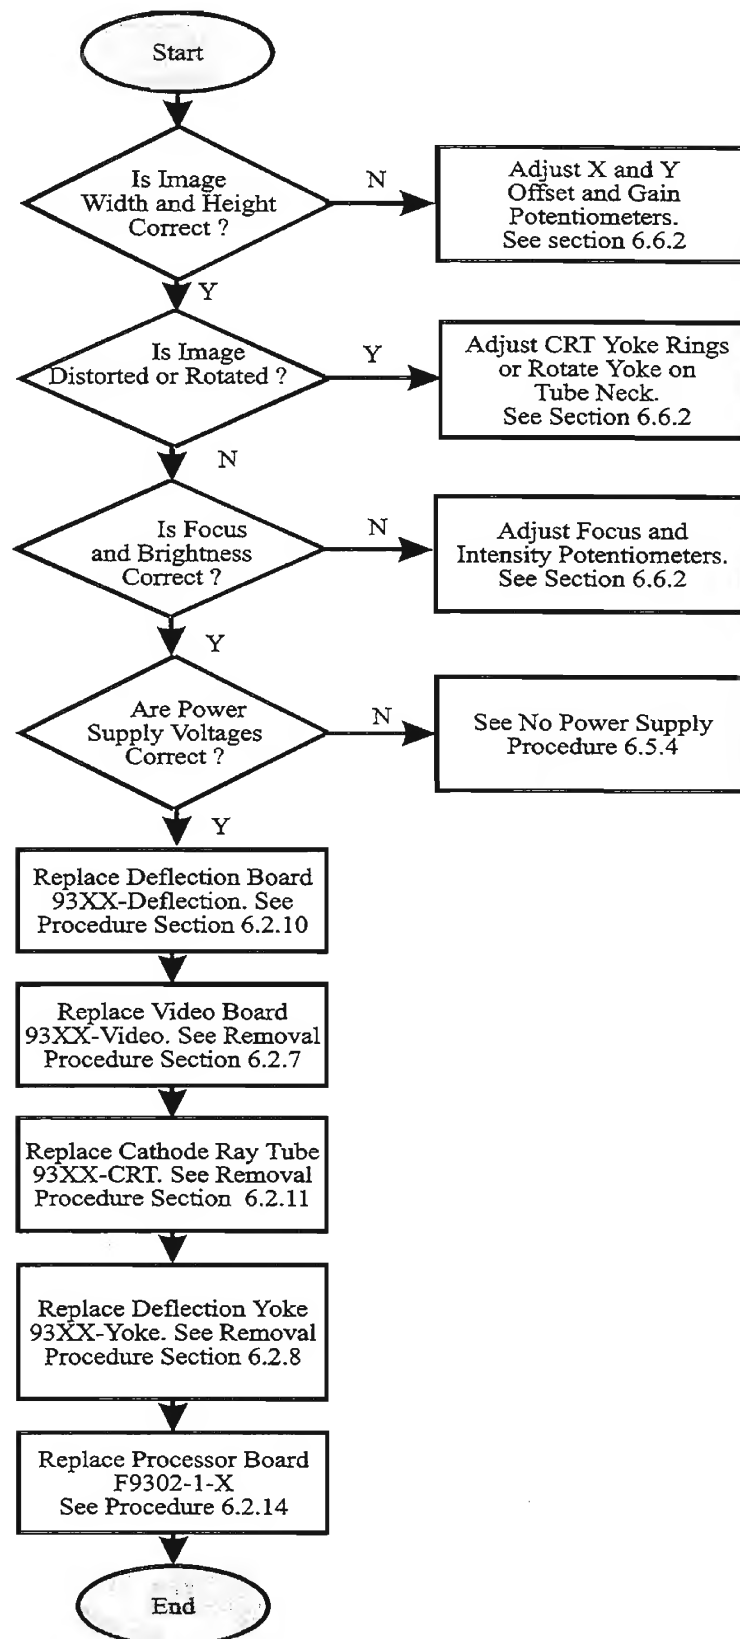

- Turn off the power and disconnect the line cord from the instrument
- Open the fuse box by inserting a small flat screwdriver under the plastic cover and remove the fuse carrier from the holder
- Remove the 6.3 amp fuse and replace it with the proper type:

6.3 amp/250 V, normal blowing.
LeCroy part number: 433 162 630

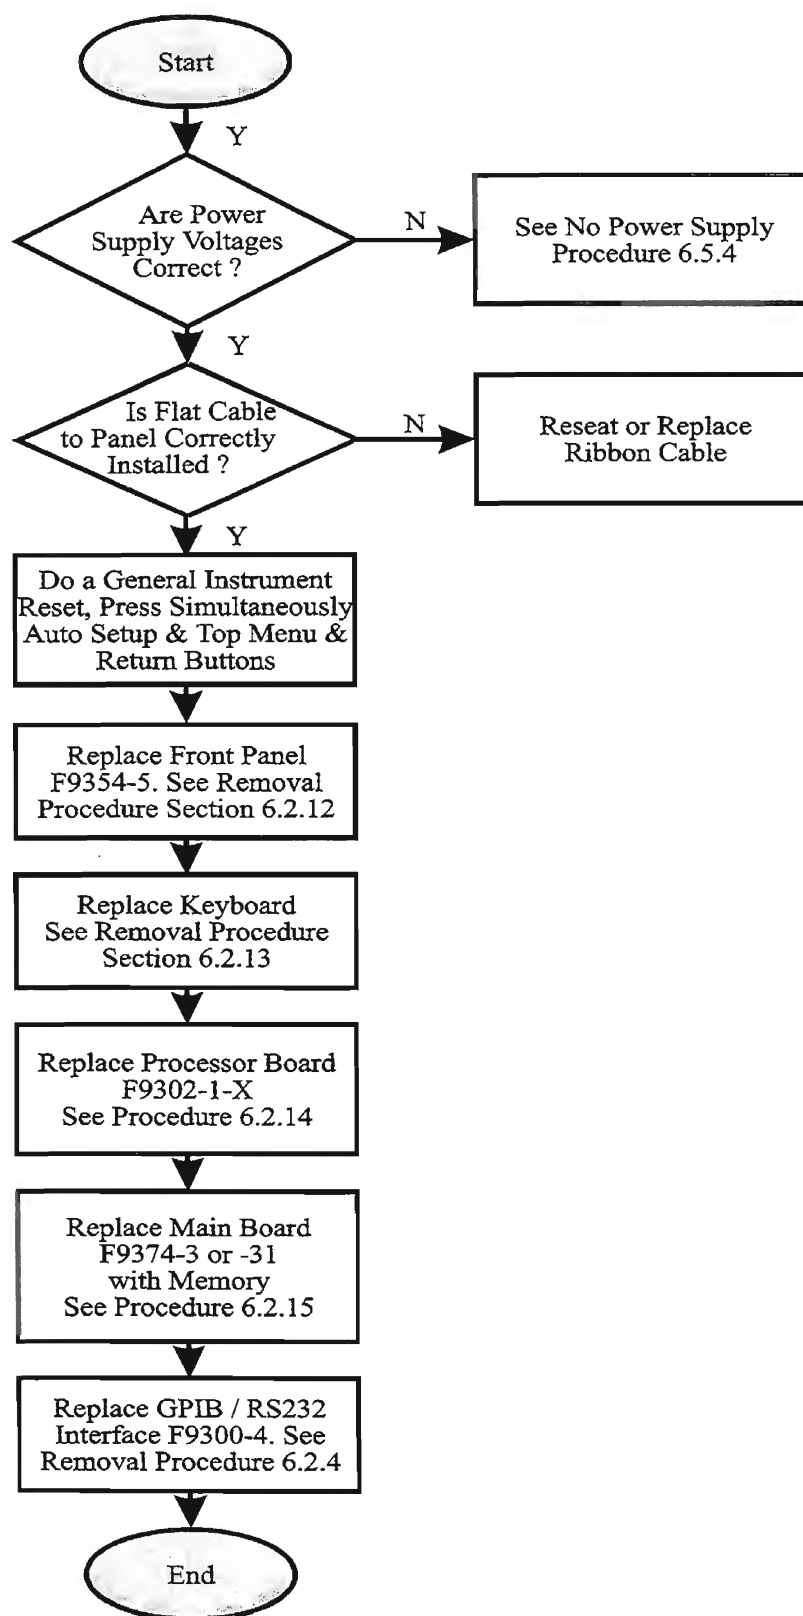

6.5.5 No Display

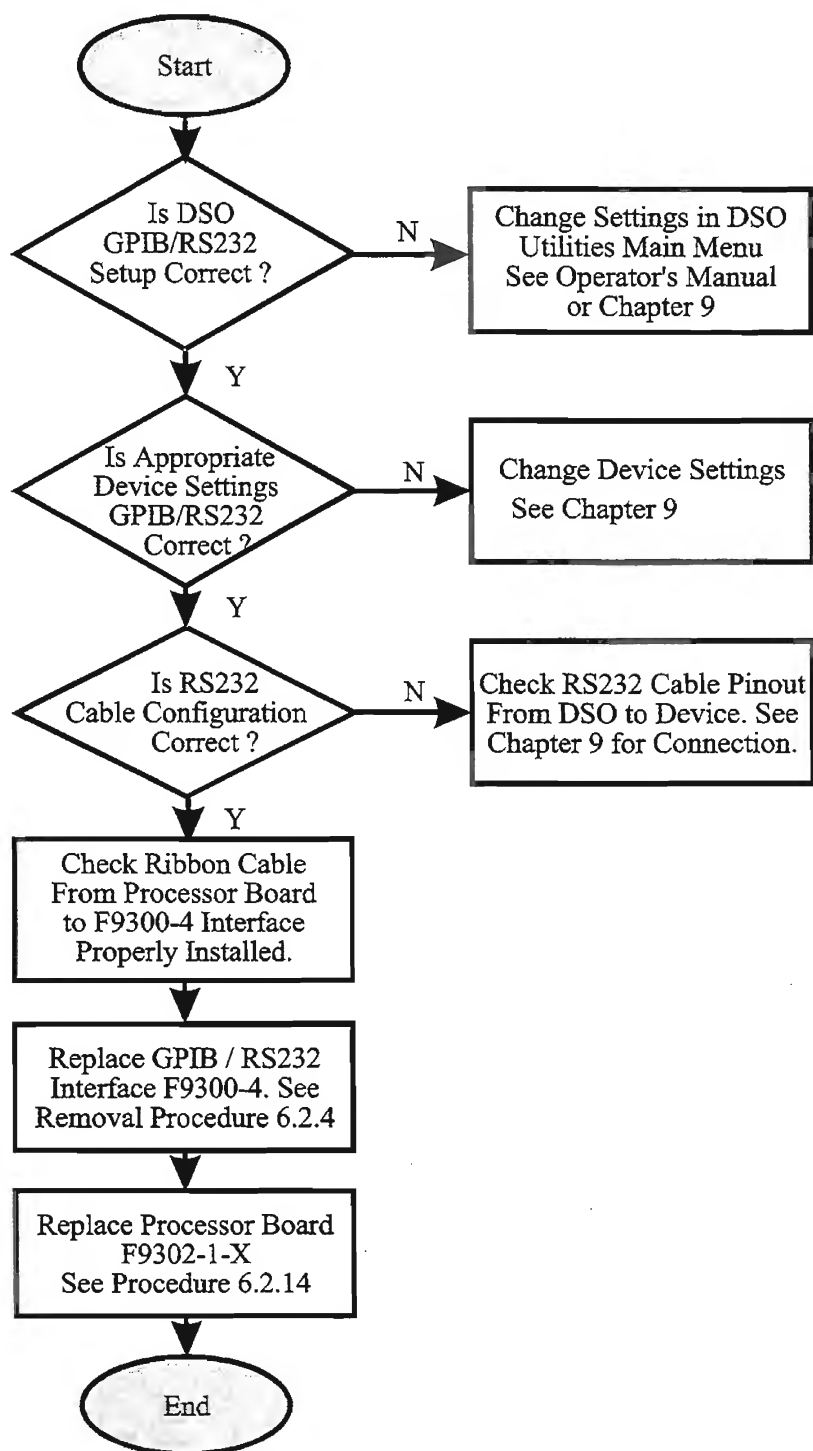

6.5.6 Abnormal Image On Screen

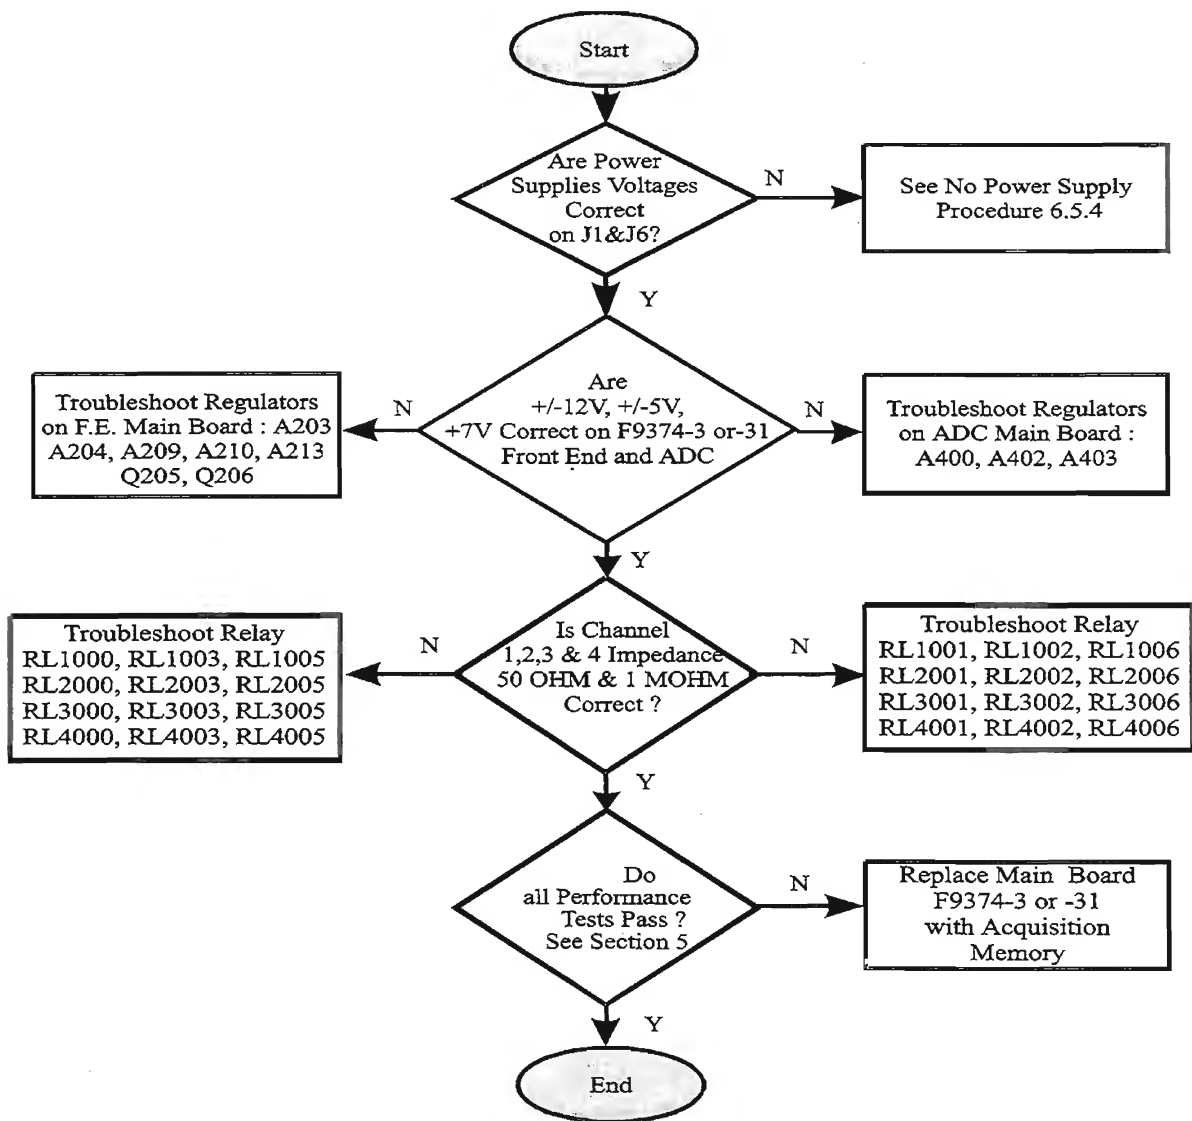

6.5.7 Front Panel Controls Do Not Operate

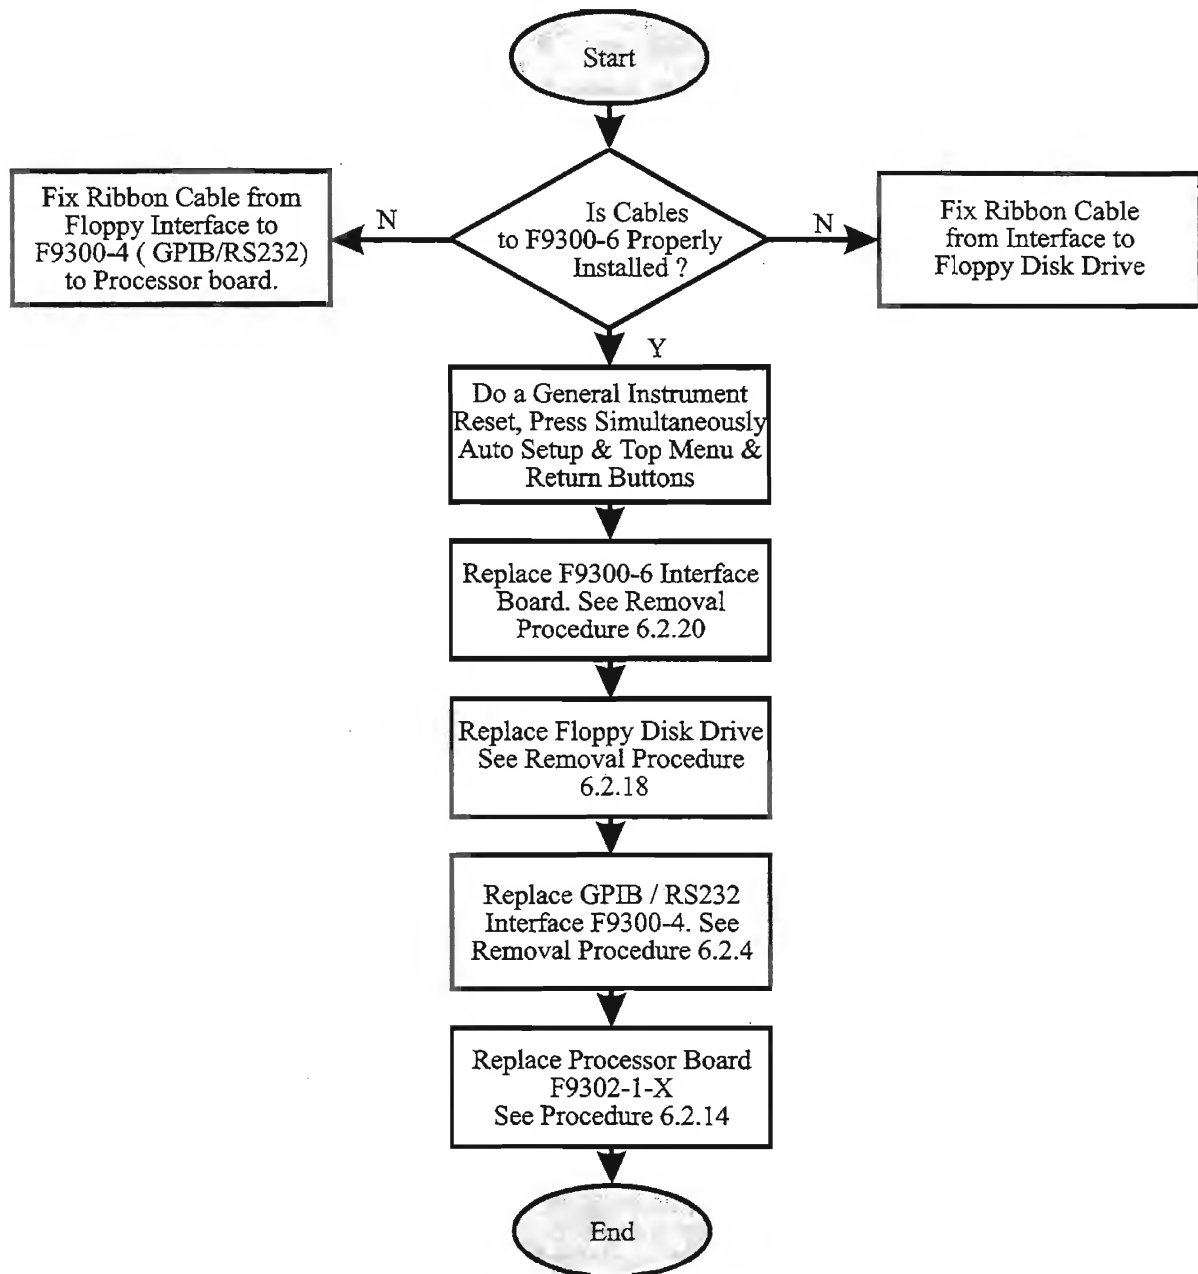

6.5.8 No Remote Control GPIB and RS232

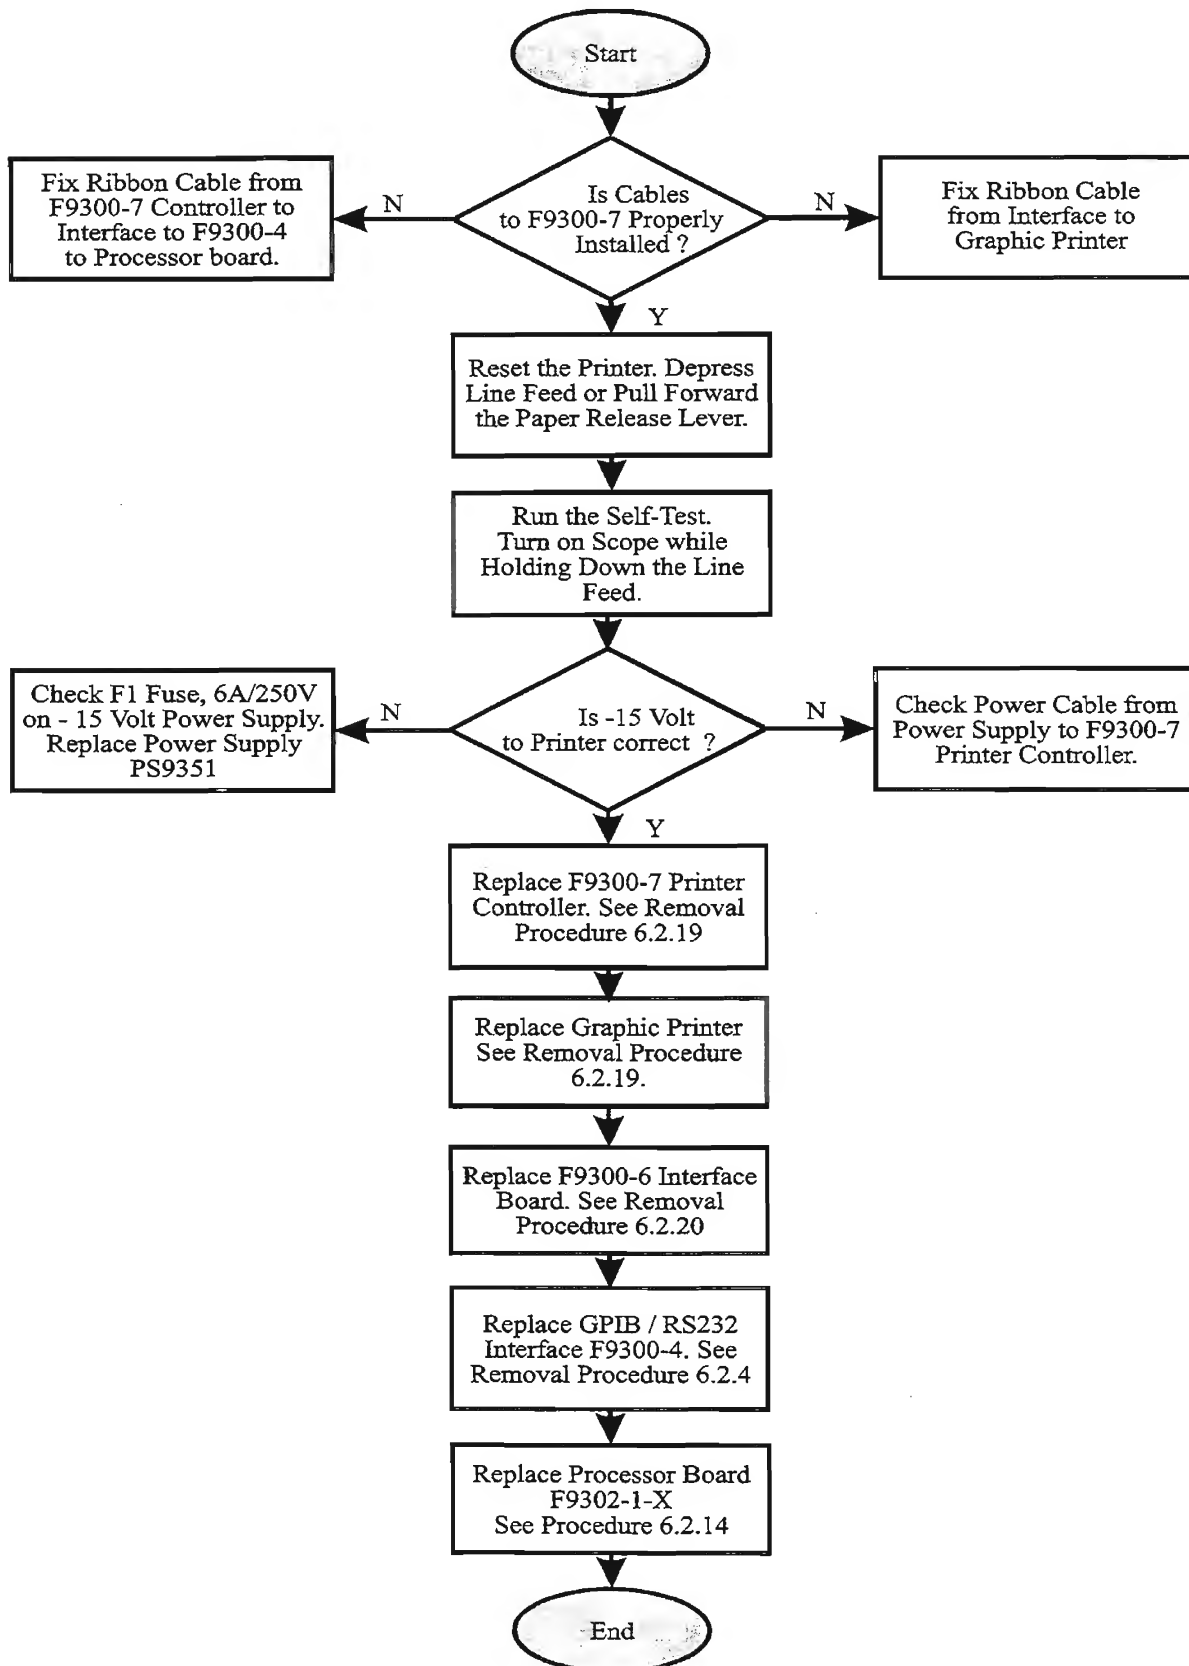

6.5.9 Performance Verification Fails

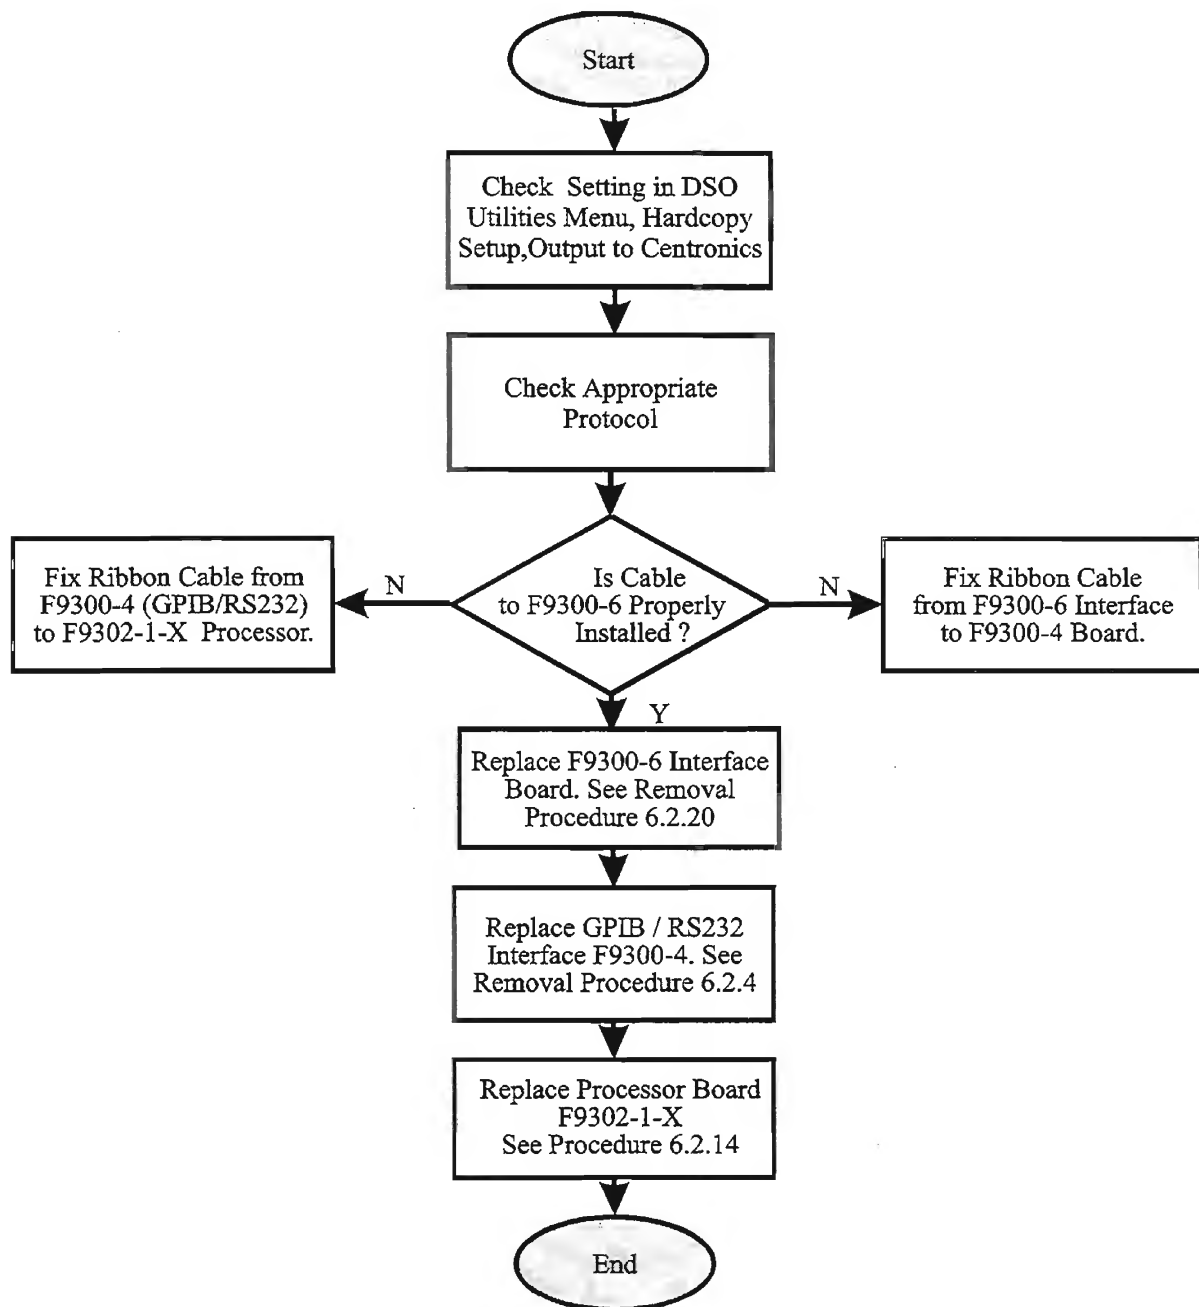

6.5.10 Floppy Disk Drive Fails

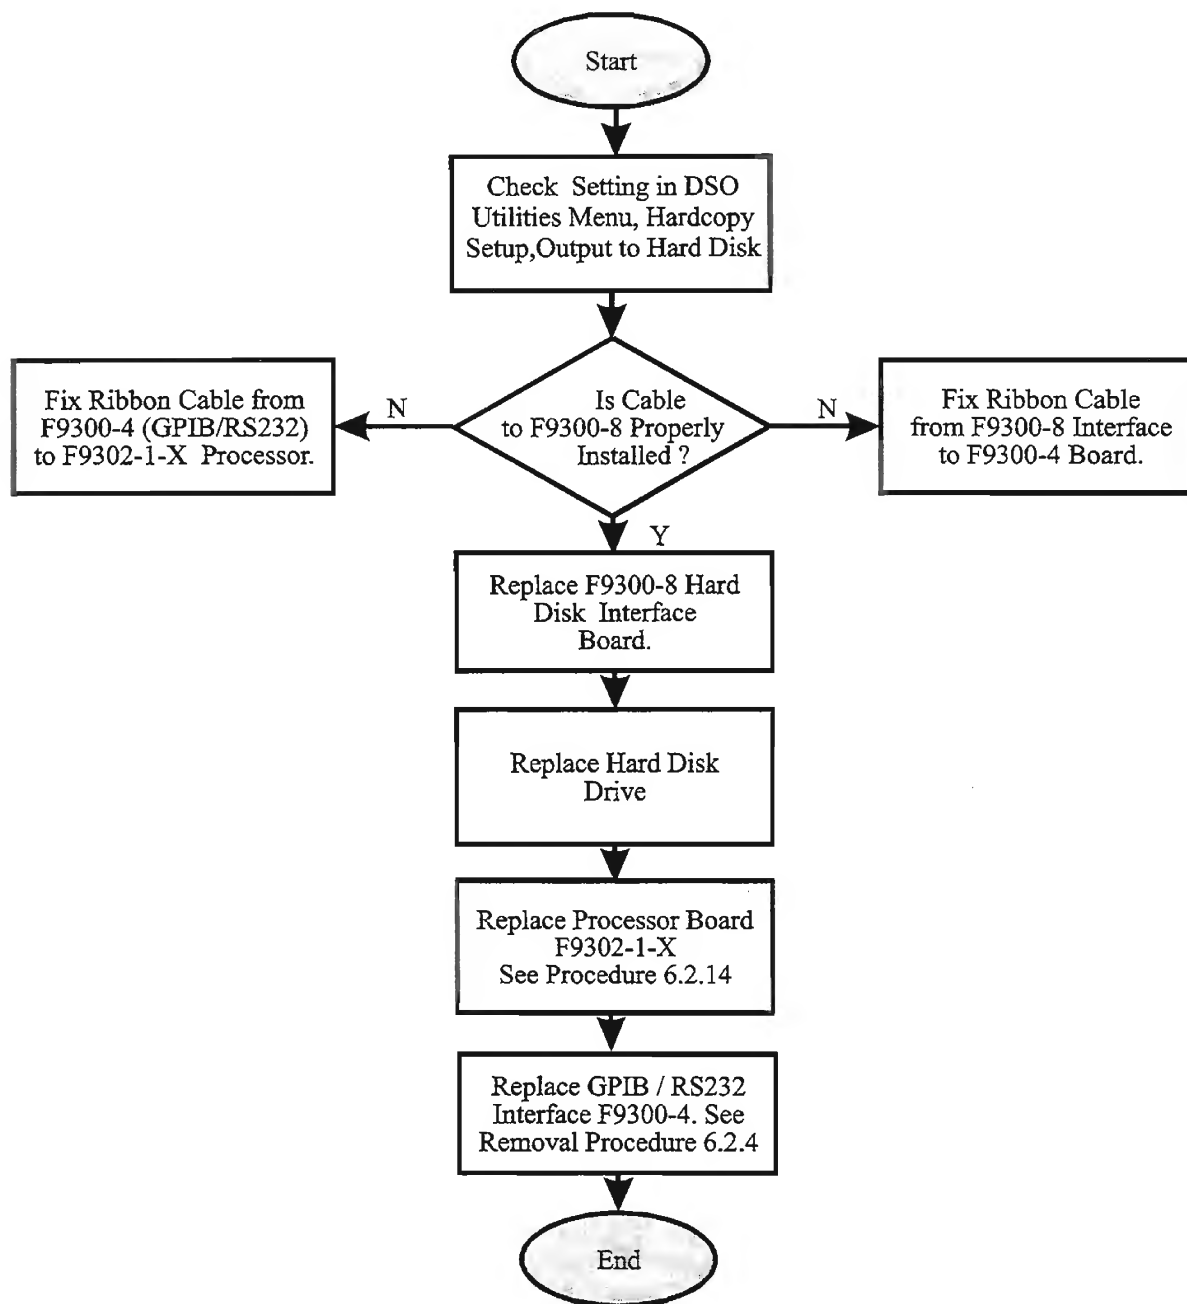

6.5.11 Graphic Printer Fails

6.5.12 Centronics Fails

6.5.13 Hard Disk Fails

6.6 Calibration Procedures

The following section includes the adjustments required for the power supply, front end and display. It is recommended that they be verified at one year intervals.

6.6.1 PS9351 Power Supply Calibration

The four voltages are adjustable by $\pm 5\%$ of the nominal value.

The reference for the measurements are the pins on top of connector J1 connected to the main board F9374-3 or -31.

For the power supply calibration proceed as follow:

- Turn off the power
- Remove the top cover (6.2.1)
- Remove the front frame assembly (6.2.9) and put it to the right of the unit.
- By using two extension cables, reconnect the processor board to the front panel (J4) and to the deflection board (J6).
- Once the top cover is removed and the front panel is disassembled from the scope, extra cooling of the main board is required. It's mandatory to disconnect the existing Fan from connector J3, located on F9374-3 or -31 card, and to use a Fan with the air flow oriented to the front end section of the board.
- The front frame assembly is now reconnected to the processor through the extension cables.
- Turn on the power, set the scope to Auto Trigger, and perform the adjustments to get on J1 & J6 (see figure 6. 8).

J1 Pin 4, 5, 6	: + 5.12 V (Min = + 5.05 V, Max = + 5.15 V)
J1 Pin 9, 10, 11	: - 5.2 V (Min = - 5.15 V, Max = - 5.25 V)
J6 Pin 1	: + 15 V (Min = +14.9 V, Max = +15.1 V)
J6 Pin 3	: - 15 V (Min = -14.9 V, Max = -15.1 V)
J1 Pin 3, 7, 8	: Ground
J6 Pin 2	: Ground

The four potentiometers are accessible from the right side through holes in the PS9351 power supply chassis.

- Turn the potentiometer clockwise to increase the tension or counterclockwise to decrease the voltage. When the adjustment is done, stop the acquisition by depressing the stop trigger push button, and verify that there is no large difference on the + 5.12 V, typically less than 80 mV.

Figure 6.8 : PS9351 Power Supply

6.6.2 93XX-Display Adjustment Procedure

6.6.2.1 Introduction

There is a total of 12 potentiometers or variable coils to adjust the deflection and video board.

Video: (2 adjustments)

- **Threshold** : **Level of the video board.**
- **Gain** : **Intensity of the screen.**

Video board component side

Deflection : (10 adjustments)

- **Vosc** : **Frequency of the vertical oscillator.**
- **Slope** : **Speed of the horizontal ramp.**
- **Focus** : **Focus of the screen.**
- **Cut off** : **Cathode ray tube cut off.**
- **Quiescent** : **Standby current of the horizontal deflection amplifier.**
- **H Linearity** : **Horizontal linearity.**
- **H Size** : **Horizontal size (Max 165mm).**
- **H Offset** : **Horizontal position.**
- **V Size** : **Vertical size (Max 120mm).**
- **V Offset** : **Vertical position.**

Deflection board component side

6.6.2.2 Coarse Adjustment

- Depress display button.
- Set W'form + text intensity to 0%.
- Set grid intensity to 0%
- Turn fully clockwise the intensity potentiometer on the video board.
- On the video board connect a digital multimeter on test point : W303
- Adjust threshold potentiometer to get $2\text{ V} \pm 0.1\text{ V}$ on W303.

☐ AUTO

- Set W'form intensity to 100%.
- Set grid intensity to 60%.
- Adjust H-size, H-offset, V-size, V-offset to center the image in the screen.
The vertical position should be adjusted to get the push buttons of the front panel in front of the software menus, use the utilities set up.
The small magnets mounted on the deflection yoke influence the vertical position.
- Turn the quiescent potentiometer clockwise until the default of the horizontal lines just disappears from the vertical center of the screen.
- Increase the cut off until a vertical line appears on the right side of the screen.
- Adjust the slope potentiometer to get 5mm gap between the highlighted vertical line and the right border of the selection menus.
- Adjust H-linearity to get the best linearity.

6.6.2.3 Fine Adjustment

The final adjustment of the intensity, cut off, and focus must be made in a dark room.

- Set W'form intensity to 30%.
- Set grid intensity to 0%.
- Adjust the cut off potentiometer until the highlighted vertical line disappears from the right side of the screen.
- Set W'form intensity to 20%.
- Display four traces.
- On the video board adjust the gain potentiometer (intensity) in order to get the text just readable.
- Set W'form + text intensity to 70%.
- Set grid intensity to 30%

- Adjust the focus (usually fully clockwise) for most uniform focus over the entire screen.
- In a standard luminosity environment set W'form + text to 90%, and grid intensity to 60%.
- Verify the intensity, focus, and contrast adjustment, for best definition of the displayed text.

CAUTION

Never change the Vosc calibration.

Chelating of iron and aluminum by the addition of EDTA and DTPA to the water was studied. The results showed that the addition of these chelating agents to the water significantly reduced the iron and aluminum concentrations in the water. The results also showed that the addition of these chelating agents to the water significantly reduced the iron and aluminum concentrations in the water.

Figure 8.11 : 9374/M/L/TM DSO Dimensions

SECTION 9 CONNECTING the 9374/M/L/TM to a PLOTTER or a PRINTER

9.1 Introduction

LeCroy oscilloscopes are supplied with a list of plotters and printers known to work with them.

This list is not final, so any suggestions are welcome.

HP plotter responses to some RS-232 configuration commands have been evolved. Consequently, the 9374/M/L/TM generation DSO support HP plotters of two types, 7470A and 7550A. The only difference lies in the RS-232 initialization codes. They may however, despite these changes, work with HPGL compatible plotters from other manufacturers. If the HPGL data is used as input for a CAD or word processing system, it might be necessary to remove the data preceding the in command. Before connecting a plotter to a 9374/M/L/TM, do not forget to select the appropriate settings in the printer setup menu and the GPIB & RS-232 setup menu.

RS-232 connection

The following settings are assumed for the scope.

Baud rate : 9600
Character : 8 bits
Parity : none
Stop bits : 1
Any exceptions will be mentioned.

RS 232 interface

Pin 1 : DCD
2 : RD
3 : TD
4 : DTR
5 : GND
6 : DSR
7 : RTS
8 : CTS
9 : RI

A cable with the following pinout can be used in almost every case:

The cable has D25 connector with male pins on the plotter side, and a D9 connector with female pins on the 9374/M/L/TM oscilloscope side.

GPIB Connection

To have a plot done through GPIB initiated with the front panel screen dump push button, you must set the 9374/M/L/TM in talk only mode by selecting remote control from RS-232, and the plotter in listen only mode.

If a computer controls the GPIB Bus, both the scope and the plotter must be set in addressed mode (remote control from GPIB).

Remark: the listen only mode does not work on some old HP plotters such as HP7585B or HP7475. The plotter must be set to listener before being able to receive any commands, which is a violation of the GPIB standard.

9.2 Plotters

9.2.1 HP 7470A Plotter

Switch settings:

- RS-232 Connection:
 - S1 and S2 : 0 0
 - Y/D : D
 - A4/US : User selectable
 - B4 to B1 : 1 0 1 0
- GPIB listen only:
 - A4/US : User selectable
 - 16 to 1 : 1 1 1 1 1
- GPIB Addressed:
 - A4/US : User selectable
 - 16 to 1 : 0 0 1 1 1

9.2.2 HP 7550A Plotter

Responses to some ESC characters commands are not the same in this plotter as in older HP models like the 7470A. In fact, ESC sequences of commands which give excellent results in the 7470A can prevent any handshake in RS-232. Problems of this kind have been reported in the case of ESC.R and ESC.@ commands. When combined with ESC.I and ESC.N, ESC.@ breaks up all handshakes.

RS-232 configuration:

- Enter into display 5 (HP-IB MONITOR...).
- Select STANDARD OF STANDARD/ENHANCED.
- Enter into SERIAL sub-menu (display 6)
- For DATA_FLOW, select REMOTE. Either STANDALONE or EAVESDROP may be chosen.
- Enter into display 7 (DUPLEX, PARITY, BAUD).
- Select FULL duplex.
- Configuration PARITY and BAUD rate to the same values as on the DSO.

A standard cable may be used.

Do not start a plot while a sheet of paper is being loaded!

GPIB configuration:

If the scope is in TALK ONLY, the plotter must be in LISTEN ONLY. Selection will be done at display 5.

Note : It seems that the plotter must be powered off, then on again, to take any configuration change into account.

9.2.3 Hitachi 672 Graph Plotter (or NSA 672)

As this plotter is compatible with the 7470A, select this mode on the plotter menu page.
Switch settings

- RS-232 Connection:

Sw. A, 1 and 2 : 1 1 (ISO A3) or (ISO A4).
Sw. A, 3 to 8 : 1 0 1 1 0 1
Sw. B : 1 1 1 1

Note : When switches are set to ISO A4, the pen must be manually repositioned at the top of the page (or plotter reset by powering it off and on) before loading a new sheet of paper.

9.3 Printers

Interfacing is possible through RS-232, GPIB directly, and in option through Centronics. The parallel interface F9300-6 (Centronics) is an option, see section 4.5.

9.3.1 Centronics Printers

Most printers use a Centronics parallel connection which makes direct connection possible if the 9374/M/L/TM is equipped with the optional Centronics interface F9300-6 board. If the printer has a Centronics connector then it's a parallel printer, and the F9300-6 board is required or a serial to parallel converter.

If a serial to parallel converter is used, in the printer setup menu select device type Epson, and remote control from RS-232.

RS-232 Remote control port settings:

Baud rate : 9600 or 19200
Characters length (bits) : 8
Parity : none
Number of stop bits : 1

The following printers and printer switch positions have been tested via serial to parallel adapter.

	Switch 1	Switch 2
1. Epson LQ-1000	1, 2, 3, 4 : ON	2, 6, 7 : ON
2. Diconix 150P	1: ON	2, 6, 7 : ON
3. HP-ThinkJet 2225C	2, 4, 5 : ON	
4. HP-DeskJet 550 C	all down	6 up for 19200 bauds

Note: all Epson and Epson Compatible printers are likely to work if the switches are set properly, (Some experimentation may be required).

Some available serial to parallel converters need power through the RS-232 lines. Do not use them, as we do not guarantee that the serial port is able to furnish enough power.

9.3.2 RS-232 Printers

9.3.2.1 Epson FX80

It is possible to use the standard RS-232 cable. Such a printer has the optional RS-232 interface " #8143 " installed. The configuration that follows is valid for the default scope setting. The standard cable is usable.

In the particular case of an FX850:

- the main switches SW1 SW2 remain at the factory configuration

SW1	:	1	2	3	4	5	6	7	8
		OFF	OFF	ON	OFF	OFF	ON	ON	ON

SW2	:	1	2	3	4
		ON	OFF	OFF	OFF

- the 8143 switches are set to:

1	2	3	4	5	6	7	8
ON	OFF	OFF	OFF	n/a	OFF	OFF	ON

- the 8143 jumpers remain at the factory settings:

J1	J2	J3	J4	J5	JC	JNOR	JRVE	JF	JX
OFF	OFF	OFF	OFF	ON	OFF	ON	OFF	ON	OFF

Note: Epson printers only support XON/XOFF support handshake if they have a print buffer. Such printer are : FX, FX+, JX-80, LQ-800/1000, EX-800 and LQ-25000. Otherwise, use DTR/RTS handshake.

9.3.2.2 Citizen 120D

To use this printer with the default RS-232 setting and default printer setting of the 9374/M/L/TM, select the following switch configuration:

DIP switch bank 1 : all OFF except 3 and 8, DIP switch bank 2 : all OFF.

9.3.2.3 HP LaserJet

Make sure that page feed is ON in the plotter menu to use the LaserJet. It is advisable to start out in single density with a size of A5. Then, depending upon the internal buffer size on the LaserJet, the image size and/or density can be increased. At one point, the internal buffer size of the DSO is also reached. The image is simply truncated, indicating that either density or size have to be reduced.

9.3.2.4 HP QuietJet

9.3.2.5 HP ThinkJet

To use printer with the default RS-232 setting and with the default cable select the following switch configuration:

- mode switch:

1	2	3	4		5	6	7	8	
0	0	0	0	:	11" page length	0	0	0	0
			1	:	12" page length				

- RS-232 switch:

1	2 3	4 5
1	0 0	0 0
(use DTR handshake)	(8bits, parity none)	(9600 bauds)

Note : it may be possible that old ThinkJet recognize only the Epson protocol. If it is the case use the Epson.

9.3.2.6 HP DeskJet 550C

The standard cable is usable. The printer has been tested at 19200 bauds with the following configuration :

Switch 1 or Bank A : all down

Switch 2 or Bank B : 6 up for 19200 bauds, all the other down

9.3.2.7 Brother Printers

The Brother M-1509 and M-1709 have been tested with a serial connection. On the oscilloscope select "Epson FX-80 or compatible printer".

The switch settings are identical for both the printers:

- SW1 :	1	2	3	4	5	6	7	8
	ON	ON	ON	OFF	ON	n/a	n/a	ON
- SW1 :	1	2	3	4	5	6	7	8
	←		ALL OFF			→		
- SW1 :	1	2	3	4	5	6	7	8
	OFF	OFF	OFF	OFF	11" : OFF	OFF	ON	OFF
					12" : ON			

9.3.3 GPIB Printers

9.3.3.1 HP QuietJet

Make sure the dip switches on the backplane of the printer are set to

- SRQ enable: 0
- GPIB listen only:
 - Listen always: 1
 - A5 to A1: 0 0 1 1 1
- GPIB Addressed:
 - Listen always: 0
 - A5 to A1: 0 0 1 1 1

9.3.3.2 HP ThinkJet (HP 2225A)

Make sure the dip switches on the backplane of the printer are set to

- SRQ Enable: 0
- GPIB listen only:
 - Listen always 1
 - A5 to A1: 0 0 1 1 1
- GPIB Addressed:
 - Listen always: 0
 - A5 to A1: 0 0 1 1 1

9.3.3.3 HP PaintJet (black/white only)

Make sure the dip switches near the GPIB connector are set to:

- GPIB Listen only:
 - NORM/SCS: NORM
 - A3 to A1: 1 1 1
 - PC8/ROM8: N/A
 - ENG/MET: has to match paper size ENG = 11" MET = 12"
- GPIB addressed:
 - NORM/SCS: NORM
 - A3 to A1: any combination except 1 1 1
(correspond to add. 0-6)
 - PC8/ROM8: N/A
 - ENG/MET: has to match paper size ENG = 11" MET = 12"

9.4 Information on GPIB

9.4.1 Introduction

This section is a simple description of the GPIB interface as an aid to understanding the interface in the 9374/M/L/TM DSO: it is not intended as a complete specification of the system.

The GPIB system is designed for the interaction of a number of devices, which may transmit or receive information as required. The system includes data lines over which the actual data are sent, bus management lines for control, and handshake lines to ensure correct acceptance of data at the right destination. The main features of the bus are summarized below:

Maximum number of devices	15
Maximum bus length	20 meters or 2 meters per device, whichever is less.
Connection	star or chain

Note that more than half of any connected devices must be powered up, even if they will not be used.

Data lines	8 DIO	1 to 8
Handshake lines	DAV NRFD NDAC	Data available Not ready for data not data accepted
Bus management lines	EOI IFC SRQ ATN REN	End or identity Interface clear Service request Attention Remote enable
Active level	+0.4 V	
Inactive level	+3,3 V	

Note that all signal lines are active low, and that they are wire ORed to allow participation by all devices.

In addition, there are 8 ground lines, making a total of 24 lines.

9.4.2 Functions in the GPIB

In order to allow satisfactory interconnection of several devices the following functions must be provided

- Enabling any device to transmit data
- Preventing any device from transmitting data
- Enabling any device to receive data

- Preventing any device to receive data
- Transmitting data to a specific device
- Ensuring that only one device is transmitting
- Ensuring that transmitting takes place only when reception is possible
- Enabling any device to request servicing
- Identify type of data to be sent

Any device can be activated into the "talk" or "listen" state, and can be deactivated by the commands "untalk" and "unlisten". Also a device can be a "controller".

Maximum number of current talkers	1
Maximum number of current listeners	14
Maximum number of current controllers	1

Function of bus lines:

- DAV Data available; talker says the data on the line are valid.
- NRFD Not ready for data; listener says it is not ready for more data.
All listeners must release the NRFD line, i.e., let it go high, before talker can send.
- NDAC Not data accepted; listener says it has not yet accepted the data. Talker must hold all data lines steady until all listeners have released this line, i.e., it goes high.

Clearly, the NRFD and NDAC are easy to implement by a wired OR system, so that any one device asserting the signal prevents progress to the next step. Progress is made at the speed of the slowest listener. A simple timing diagram is given in figure 9.1.

The bus management lines functions as follows:

- EOI End Or Identify; talker sends this with last byte of a block transfer to indicate last byte. Also used with ATN to parallel poll devices for their status bit.
- IFC InterFace Clear; places the GPIB system into a quiescent state.
- SRQ Service ReQuest; any device can send it to the controller to indicate need for attention, and to request interruption of current operations.
- ATN ATeNtion; controller sends this to specify whether DIO lines are to be used for interface messages, e.g., addressing, or for data.
- REN Remote ENable; selects a device as being under local or remote control.

Addressing of the devices on the GPIB bus consult a specialized GPIB-IEEE488 document.

The principles of GPIB are quite simple - the system must wait for all users, and lines are wire ORed so that all can pull the lines down. The handshake sequence is illustrated in two ways. In figure 9.1 the signal waveforms are sketched.

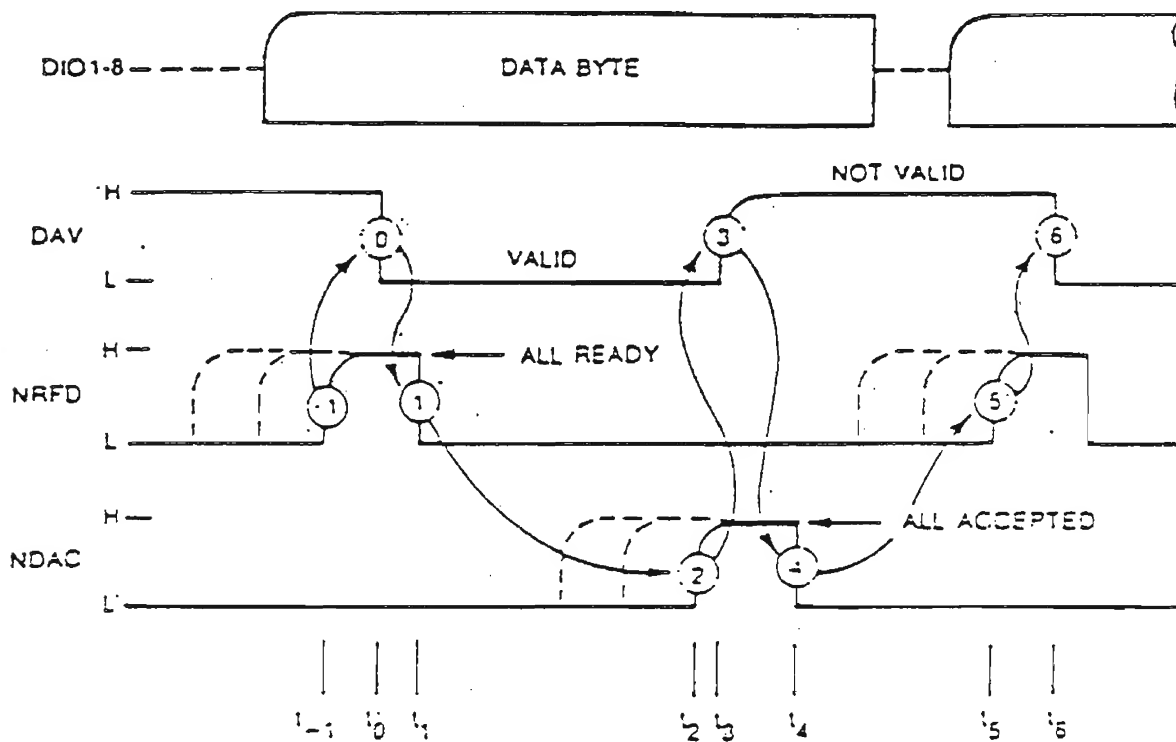

Figure 9.1 : DATA BYTE TRANSFER IN GPIB IEEE-488

The handshake timing sequence proceeds as follows:

Preliminary	The source checks for presence of listeners and places the next data byte on the data lines DI01-8.
t-1	Acceptors one by one become ready for byte. Last one allows NRFD to go high.
t0	Source pulls down DAV to validate data.
t1	The first listener to accept the data pulls down NRFD to show it is no longer ready for a new byte.
t2	The listeners one by one accept the data, and the last one lets NDAC go high.
t3	The source sets DAV high to show this byte is no longer valid.
t4	The listeners one by one accept this, the first one pulling NDAC low for the next cycle.
t5	As for t-1.
